Example: What is a Custodian Bank? A custodian bank is a special financial institution that carries the responsibility for protecting the financial assets of individuals or companies. These institutions can also be called simply custodians. Such outfits serve as a third party check that protects the assets they are guarding against the fund managers and any illegal activities they may pursue. Congress established these custodian banks with the Investment Company Act of 1940 in order to protect investors. Thanks to this particular legislation, investment companies must adhere to specific stringent listing requirements and must be registered with the Securities and Exchange Commission. The custodian bank performs a number of activities in their primary function of watching over the financial assets of businesses and individuals. They settle sales and purchases of bonds and equities and physically protect the certificates of these assets. These institutions also gather information about and income from such assets. When the assets are stocks this means dividends. When the instruments are bonds, they collect the interest from the coupons. The custodians also disperse information they gather, pertaining to yearly general meetings and shareholder voting. They handle any foreign exchange transfers as necessary and manage all cash transactions. Finally, custodians deliver routine reports on their various activities to the customers. Custodians banks provide reports on every trade or deal which they transact on behalf of the clients. They must be consistently delivered. Along with these reports they furnish information on the companies whose assets they hold besides information on general meetings. When a custodian is holding foreign shares or bonds, they will also have to change currencies as necessary. This is the case when the fund manager buys or sells foreign currency assets. It is also necessary when companies pay out dividends or bonds receive interest with these overseas financial instruments. Custodian banks are a critical component of the modern investment environment. Without them to carry out these functions, all of the important financial record keeping and housekeeping items would be neglected. Not all custodian banks are national operations in the United States. A number of the major international financial institutions offer these services around the globe. Example: What is a Chain of Title? A chain of title refers to the consecutive historical transfers in a title on a particular piece of real estate property. These chains start with the current owner of the property and trace their way back to the property's first owner. Reconstructing such a chain can be extremely important when a lender needs complete ownership documentation. Such title documents are generally kept by registry offices with local and municipal governments. The field of real estate places tremendous importance on such a chain of title. Because it can be difficult to construct them, companies have come up with systems to track ownership and registration of real estate property. One of these is the Torrens Title system. Insurance companies in the United States will provide title insurance on a property. They do this using the chain of title on real estate that the owners are transferring. These chains are so important that many title insurance companies will keep their own private title operations to track such titles so they do not have to rely on only official government records. In cases where it is difficult to come up with a complete chain, abstracts of title can be utilized. Attorneys will sometimes certify these. Lack of a clear chain of title has caused significant problems during the Great Recession of 2008. These problems began when many lending companies made the choice in 1995 to use an electronic registry to hold the title. The best known company in this arena was MERS Mortgage Electronic Registration Systems. The banks tried to use this system so they could sell and purchase mortgages without needing to register ownership changes with the appropriate local governments. Without clear title chains, the banks were often not able to come up with the original titles needed to force foreclosures and evictions as individuals defaulted on their mortgages. A number of states throughout the U.S. sued the banks over these actions. The chain of title is also utilized in intellectual property areas. With the film industry, they refer to documentation that demonstrates the ownership rights of a particular movie. These chains can be used in other creative endeavors in the movie business. If many individuals contributed to the creative work, authorship is owned by a large number of the writers. Note: This example description is shorted due to publish restrictions. Example: What are Corporate Bonds? Corporate bonds are debt securities that a company issues and sells to investors. Such corporate bonds are generally backed by the company's ability to

repay the loan. This money is anticipated to result from successful operations in the future time periods. With some corporate bonds, the physical assets of a company can be offered as bond collateral to ease investors' minds and any concerns about repayment. Corporate bonds are also known as debt financing. These bonds provide a significant capital source for a great number of businesses. Other sources of capital for the companies include lines of credit, bank loans, and equity issues like stock shares. For a business to be capable of achieving coupon rates that are favorable to them by issuing their debt to members of the public, a corporation will have to provide a series of consistent earnings reports and to show considerable earnings potential. As a general rule, the better a corporation's quality of credit is believed to be, the simpler it is for them to offer debt at lower rates and float greater amounts of such debt. Such corporate bonds are always issued in \$1,000 face value blocks. Practically all of them come with a standardized structure for coupon payments. Some corporate bonds include what is known as a call provision. These provisions permit the corporation that issues them to recall the bonds early if interest rates change significantly. Every call provision will be specific to the given bond. These types of corporate bonds are deemed to be of greater risk than are government issued bonds. Because of this perceived additional risk, the interest rates almost always turn out to be higher with corporate bonds. This is true for companies whose credit is rated as among the best. Regarding tax issues of corporate bonds, these are pretty straight forward. The majority of corporate bonds prove to be taxable, assuming that their terms are for longer than a single year. To avoid taxes until the end, some bonds come with zero coupons and redemption values that are high, meaning that taxes are deferred as capital gains until the end of the bond term. Such corporate debts that come due in under a year are generally referred to as commercial paper. Corporate bonds are commonly listed on the major exchanges and ECN's like MarketAxess and Bonds.com. Even though these bonds are carried on the major exchanges, their trading does not mostly take place on them... Note: This example description is shorted due to publish restrictions. Example: What is Market Capitalization? Market capitalization refers to a company's total value. Analysts determine it by multiplying the number of shares in existence times the price of the stock. This concept can also be utilized to measure the full value of a stock exchange. The New York Stock Exchange market capitalization would equal the value of all publicly traded companies on the exchange added together. Market cap is another name for market capitalization. Examples of how this is figured make it easier to understand. Companies that have 2 million shares which have been issued that sell for \$20 apiece have a market cap of \$40 million. If an investor had enough money and could get the stockholders to agree to sell their shares, he or she could purchase the company for \$40 million total. In practice many shareholders would want more than the current share price to sell their stock. There are three different main sizes of market capitalization among traded companies. These are large cap, mid cap, and small cap corporations. Large cap companies are generally considered the least risky ones in which to invest. They typically possess substantial financial resources to survive economic downturns. They are also generally leaders in their industries. This gives them a smaller amount of growth opportunity. Because of this the returns for these large cap companies are often not as spectacular as with successful companies in the other two categories. They also have a significantly greater chance of paying dividends out to their share holders. Large cap corporations have \$5 billion and higher capitalization. Mid cap companies are generally less risky than the smaller companies. They still do not have the same possibilities for aggressive growth. Mid cap companies commonly possess market capitalization of from \$1 billion to \$5 billion. Studies have shown that mid caps have outperformed large cap and small cap corporation stocks in the past 20 years. Small cap corporations are those which possess under \$1 billion in market capitalization. These tinier companies have often completed an Initial Public Offering in the recent past. Such companies are considered the riskiest of the three types. This is because in economic downturns, they have the greatest chance of failing or defaulting. They also enjoy plenty of opportunity and space to expand. This means that they potentially could be extremely profitable if they succeed. Note: This example description is shorted due to publish restrictions. Each term is explained with 600 words and more.
