Ratemaking in International Air Transport - Peter Haanappel 2013-06-29

Ratemaking in international air transport is a matter of vital importance for airlines, consumers and Governments. For airlines, because the level of international air fares and rates forms one of the bases of their profit-making ability. For consumers, because that level determines whether they can afford the use of international air transport. For Governments, because they, as

the guardians of the interests of both the airlines and the consumers, have the task to strike a just balance between those interests. International air fares and rates are of two kinds: scheduled and non-scheduled. The International Air Transport Association (IATA), the trade association of the world's scheduled international airlines, determines, under Governmental supervision and control, uniform fares and rates for scheduled international air services. These services account for approximately seventy-five percent of total international air traffic. The remaining twenty-five percent consists of non scheduled, or charter

international air services. International charter air fares and rates are by and large set by the free forces of the marketplace, and compete with scheduled international (IATA) air fares and rates. This book studies both scheduled and charter international air fares and rates. It examines the role of airlines, airline associations and Governments in the international ratemaking process. Furthermore, it analyses the competitive relationship between charter and scheduled international air fares and rates.

Do Caribbean Exporters Pay Higher Freight

Costs? - Alexander J. Yeats 1989

The objective of this study is to analyze transportation costs incurred by Caribbean countries on their major export products to determine whether there is evidence of freight rate discrimination against these countries, or whether their transport costs are significantly different from those of other exporters. A key finding is that a distinction must be made between freight rates for air cargo services as opposed to ocean transport. For exports by ocean carriers the empirical evidence is quite different than that for air shipments. This study also finds

that Caribbean exporters are more likely to experience adverse transport costs on food and agricultural raw materials than they are on manufactured goods where a relatively high percentage of shipments are by air. The report also suggests the following lines of analysis: how the Caribbean countries might best exploit the major cost advantage they have for products exported by air, why is ocean transport less cost efficient than air freight for Caribbean countries, and why do large adverse transport cost differentials appear to be concentrated in certain product groups like food and agricultural raw

materials?

This book uses numerous examples to describe the current opportunities and risks of air freight against the backdrop of stagnating transport volumes since the financial crisis in 2008. It shows what impact these developments have had

on those involved, in particular shippers, airlines, airports and freight forwarders. The application-oriented presentation also provides an insight into the design of complex supply chains and the areas of tension in which the players in air freight operate.
