*Ghostly Apparitions* - Stefan Andriopoulos 2013-08-02

A media archaeology that traces connections between new media technologies and distinct cultural realms, considering topics that range from Kant's philosophy to somnambulist clairvoyants. Drawing together literature, media, and philosophy, *Ghostly Apparitions* provides a new model for media archaeology. Stefan Andriopoulos examines the relationships between new media technologies and distinct cultural realms, tracing connections between Kant's philosophy and the magic lantern's phantasmagoria, the Gothic novel and print culture, and spiritualist research and the invention of television. As Kant was writing about the possibility of spiritual apparitions, the emerging medium of the phantasmagoria used hidden magic lanterns to terrify audiences with ghostly projections. Andriopoulos juxtaposes the philosophical arguments of German idealism with contemporaneous occultism and ghost shows. In close readings of Kant, Hegel, and Schopenhauer, he traces the diverging ways in which these authors appropriate optical media effects and spiritualist notions. The spectral apparitions from this period also intersect with an exploding print market and the rise of immersive reading practices. Andriopoulos explores the circulation of ostensibly genuine ghost narratives and Gothic fiction, which was said to produce "reading addiction" and a loss of reality. Romantic representations of animal magnetism and clairvoyance similarly blurred the boundary between fiction and reality. In the 1840s, Edgar Allan Poe adapted a German case history that described a magnetic clairvoyant as arrested in the moment of dying. Yet even though Poe's tale belonged to the realm of literary fiction, it was reprinted as an authentic news item. Andriopoulos extends this archaeology of new media into the early twentieth century. Tracing a reciprocal interaction between occultism and engineering, he reveals how spiritualist research into the psychic "television" of somnambulist clairvoyants enabled the concurrent emergence of the technical medium.

**Mine Drop Experiment (MIDEX)** - Anthony F. Gilles  
2001-09-01

The Navy's Impact Burial Prediction Model (IMPACT 25) determines the amount of burial a mine experiences upon impacting the marine sediment. Impact burial calculations are derived primarily from the sediment characteristics and from the mine's two-dimensional air and water phase trajectories. Accurate burial prediction requires that the model's air and water phase trajectories reasonably mimic the objects true trajectory. IMPACT 25 assumes that the objects are cylindrical in shape and calculates the air and water phase trajectories entirely from momentum equations. In order to determine what effect a varying center of mass has on a mine's water phase trajectory, a Mine Drop Experiment was conducted. The experiment consisted of dropping three cylinders of various lengths into a pool

where the trajectories were filmed from two angles. The controlled parameters were, the ratio of mine length to diameter, initial velocity, center of mass position and drop angle. Results indicate that center of mass position has the largest influence on the object's trajectory and that accurate trajectory modeling requires the inclusion of both momentum and moment equations.
