Crystals, Fabrics, and Fields - Donna Jeanne Haraway 2004

Acclaimed theorist and social scientist Donna Jeanne Haraway uses the work of pioneering developmental biologists Ross G. Harrison, Joseph Needham, and Paul Weiss as a springboard for a discussion about a shift in developmental biology from a vitalism-mechanism framework to organicism. The book deftly interweaves Thomas Kuhn's concept of paradigm change into this wide-ranging analysis, emphasizing the role of model, analogy, and

metaphor in the paradigm and arguing that any truly useful theoretical system in biology must have a central metaphor.

[Family-group Names of Recent Fishes](#) - Richard Van Der Laan 2014

The family-group names of animals (superfamily, family, subfamily, supertribe, tribe and subtribe)

are regulated by the International Code of Zoological Nomenclature. Family names are particularly important because they are among the most widely used of all technical animal names. Apart from using the correct family-group name according to the Code, it is also important to use one unique universal name (with a fixed spelling) to avoid confusion. We have compiled a list of familygroup names for Recent fishes, applied the rules of the Code and, if possible, tried to conserve the names in prevailing recent practice. We list all of the family-group names found to date for Recent fishes (N=2625),

together with their author(s) and year of publication. This list can be used in assigning the correct family-group name to a genus or a group of genera. With this publication we contribute to the usage of correct, universal family-group names in the classification of, and for communication about, Recent fishes.

**Seeing Voices** - Oliver Sacks 2011-03-04

Like The Man Who Mistook His Wife for a Hat, this is a fascinating voyage into a strange and wonderful land, a provocative meditation on communication, biology, adaptation, and culture. In Seeing Voices, Oliver Sacks turns his attention

to the subject of deafness, and the result is a deeply felt portrait of a minority struggling for recognition and respect – a minority with its own rich, sometimes astonishing, culture and unique visual language, an extraordinary mode of communication that tells us much about the basis of language in hearing people as well. Seeing Voices is, as Studs Terkel has written, "an exquisite, as well as revelatory, work."

*Evolutionary Theory* - Niles Eldredge 2016-09-23

The natural world is infinitely complex and hierarchically structured, with smaller units forming the components of larger systems: genes

are components genomes, cells are building blocks of tissues and organs, individuals are members of populations, which, in turn, are parts of species. In the face of such awe inspiring complexity, scientists need tools like the hierarchy theory of evolution, which provides a theoretical framework and an interdisciplinary research program that aims to understand the way complex biological systems work and evolve. The multidisciplinary approach looks at the structure of the myriad intricate interactions across levels of organization that range from molecules to the biosphere. Evolutionary Theory: A Hierarchical

Perspectives provides an introduction to the theory, which is currently driving a great deal of research in bioinformatics and evolutionary theory. Written by a diverse and renowned group of contributors, and edited by the founder of Hierarchy Theory Niles Eldredge, this work will help make transparent the fundamental patterns driving living systems.

*Historical Archaeologies of Transhumance across Europe* - Eugene Costello 2018-03-05

Transhumance is a form of pastoralism that has

been practised around the world since animals were first domesticated. Such seasonal movements have formed an important aspect of many European farming systems for several thousand years, although they have declined markedly since the nineteenth century.

Ethnographers and geographers have long been involved in recording transhumant practices, and in the last two decades archaeologists have started to add a new material dimension to the subject. This volume brings together recent advances in the study of European transhumance during historical times, from Sweden to Spain,

Romania to Ireland, and beyond that even Newfoundland. While the focus is on the archaeology of seasonal sites used by shepherds and cowherds, the contributions exhibit a high degree of interdisciplinarity. Documentary, cartographic, ethnographic and palaeoecological evidence all play a part in the examination of seasonal movement and settlement in medieval and post-medieval landscapes. Notwithstanding the obvious diversity across Europe in terms of livestock, distances travelled and socio-economic context, an extended introduction to the volume shows that cross-cutting themes are now

emerging, including mobility, gendered herding, collective land-use, the agency of non-elite people and competition for grazing and markets. The book will appeal not only to archaeologists, but to historians, geographers, ethnographers, palaeoecologists and anyone interested in rural lifeways across Europe.

*A Tale of Seven Scientists and a New Philosophy of Science* - Eric Scerri 2016-10-10

In his latest book, Eric Scerri presents a

completely original account of the nature of scientific progress. It consists of a holistic and unified approach in which science is seen as a living and evolving single organism. Instead of scientific revolutions featuring exceptionally gifted individuals, Scerri argues that the "little people" contribute as much as the "heroes" of science. To do this he examines seven case studies of virtually unknown chemists and physicists in the early 20th century quest to discover the structure of the atom. They include the amateur scientist Anton van den Broek who pioneered the notion of atomic number as well as Edmund Stoner a then

physics graduate student who provided the seed for Pauli's Exclusion Principle. Another case is the physicist John Nicholson who is virtually unknown and yet was the first to propose the notion of quantization of angular momentum that was soon put to good use by Niels Bohr. Instead of focusing on the logic and rationality of science, Scerri elevates the role of trial and error and multiple discovery and moves beyond the notion of scientific developments being right or wrong. While criticizing Thomas Kuhn's notion of scientific revolutions he agrees with Kuhn that science is not drawn towards an external truth but

is rather driven from within. The book will enliven the long-standing debate on the nature of science, which has increasingly shied away from the big question of "what is science?"

**Copahue Volcano** - Franco Tassi 2015-09-21

This book provides a comprehensive description

of the volcanological, petrological and geochemical features of the Copahue volcano, located at the border between Argentina and Chile. Scientific studies are limited for this volcanic system, due to its remote location and difficult access in winter. However, Copahue is one of the most active volcanic systems in the southern Andes. Monitoring the volcano's activity is of utter importance, as it provides means of existence for the nearby village of the same name, hosting the world's highest-located hot-springs resort. This book's aim is to present the current monitoring activities, and to describe

future research programs that are planned in order to mitigate volcanic hazards. Special attention is therefore devoted to the social and industrial activities close to the volcano, such as health therapies and geothermal energy exploitation. In a special section, the Copahue volcano is presented as a terrestrial modern analog for early-Earth and Mars environments.

**Insect Molecular Biology and Biochemistry** -  
Lawrence I. Gilbert 2011-08-16

The publication of the extensive seven-volume work *Comprehensive Molecular Insect Science* provided a complete reference encompassing

important developments and achievements in modern insect science. One of the most swiftly moving areas in entomological and comparative research is molecular biology, and this volume, *Insect Molecular Biology and Biochemistry*, is designed for those who desire a comprehensive yet concise work on important aspects of this topic. This volume contains ten fully revised or rewritten chapters from the original series as well as five completely new chapters on topics such as insect immunology, insect genomics, RNAi, and molecular biology of circadian rhythms and circadian behavior. The topics included are key to

an understanding of insect development, with emphasis on the cuticle, digestive properties, and the transport of lipids; extensive and integrated chapters on cytochrome P450s; and the role of transposable elements in the developmental processes as well as programmed cell death. This volume will be of great value to senior investigators, graduate students, post-doctoral fellows and advanced undergraduate research students. It can also be used as a reference for graduate courses and seminars on the topic. Chapters will also be valuable to the applied biologist or entomologist, providing the requisite

understanding necessary for probing the more applied research areas related to insect control. Topics specially selected by the editor-in-chief of the original major reference work Fully revised and new contributions bring together the latest research in the rapidly moving fields of insect molecular biology and insect biochemistry, including coverage of development, physiology, immunity and proteomics Full-color provides readers with clear, useful illustrations to highlight important research findings

**The Inequality of Human Races** - Arthur comte de Gobineau 1915

*The English it-Cleft* - Amanda Patten 2013-01-01  
This book examines the structure and function of the English it-cleft configuration from within the framework of construction grammar. It defends a straightforward extraposition-from-NP analysis (on which the cleft clause is a restrictive relative, modifying the initial it) and claims that all types of it-cleft involve nominal predication. Support for this analysis comes from three main areas: (a) the central role of definiteness in the creation of specificational meaning, (b) the existence and makeup of predicational (and proverbial) it-clefts, and (c) the early, historical it-cleft data. In

addition, the book contains a sizeable diachronic component, drawing data from the Penn Parsed Corpora of Historical English and from the International Corpus of English - Great Britain. This investigation informs and advances what is an otherwise simple account of the English it-cleft, explaining how and why the configuration has developed an assortment of peculiar, construction-specific properties over time.

Handbook of Perinatal Clinical Psychology - Rosa Maria Quatraro 2020-03-26

The book examines the major issues in perinatal clinical psychology with the presence of

theoretical information and operational indications, through a biopsychosocial approach. The multiplicity of scientific information reported makes this book both a comprehensive overview on the major perinatal mental health disorders and illnesses, and a clinical guide. It covers perinatal clinical psychology through a journey of 15 chapters, putting the arguments on a solid theoretical basis and reporting multiple operational indications of great utility for daily clinical practice. It has well documented new evidence bases in the field of clinical psychology that have underpinned the conspicuous current

global and national developments in perinatal mental health. As such, it is an excellent resource for researchers, policy makers, and practitioners – in fact, anyone and everyone who wishes to understand and rediscover, in a single opera, the current scientific and application scenario related to psychological health during pregnancy and after childbirth.

Niche Construction - F. John Odling-Smee  
2013-02-15

The seemingly innocent observation that the activities of organisms bring about changes in environments is so obvious that it seems an

unlikely focus for a new line of thinking about evolution. Yet niche construction--as this process of organism-driven environmental modification is known--has hidden complexities. By transforming biotic and abiotic sources of natural selection in external environments, niche construction generates feedback in evolution on a scale hitherto underestimated--and in a manner that transforms the evolutionary dynamic. It also plays a critical role in ecology, supporting ecosystem engineering and influencing the flow of energy and nutrients through ecosystems. Despite this, niche construction has been given short shrift in

theoretical biology, in part because it cannot be fully understood within the framework of standard evolutionary theory. Wedding evolution and ecology, this book extends evolutionary theory by formally including niche construction and ecological inheritance as additional evolutionary processes. The authors support their historic move with empirical data, theoretical population genetics, and conceptual models. They also describe new research methods capable of testing the theory. They demonstrate how their theory can resolve long-standing problems in ecology, particularly by advancing the sorely

needed synthesis of ecology and evolution, and how it offers an evolutionary basis for the human sciences. Already hailed as a pioneering work by some of the world's most influential biologists, this is a rare, potentially field-changing contribution to the biological sciences.

#### **Saproxyllic Beetles - Jörn Buse 2009**

The group of saproxyllic beetles consists of thousands of different species exhibiting a rich variety of form as well as varied life-cycle strategies. They play an important role in decomposition processes and thus for nutrient-cycling in natural ecosystems. Based on

contributions given at the conference this book contains contributions about research on conservation ecology of saproxylic beetles as well as results from recent faunistic surveys in different European regions. It comprises aspects of saproxylic beetle ecology, faunistics, diversity and conservation issues. International experts report on their activity, management strategies and new approaches in saproxylic insect conservation. There are a lot of people doing research on saproxylic beetles in different countries of the world, but this seems to be a little bit disorganized. Hopefully, these European

conferences will lead to a better, more international network. The contributions included in this volume cover a broad spectrum of research on saproxylic beetles, organized in three main chapters: "Saproxylic beetle assemblages and regional surveys" include "Oaks in Norway," showing the abundance and composition of red-listed species of beetles in hollow oaks. Further reports on regional surveys deals with a spruce primeval forest in Romania, a hardwood floodplain forest in the Czech Republic, and the Gartow region of Lower Saxony, a hotspot of saproxylic beetle diversity in north-western

Germany. "Saproxylic beetle ecology and implications for their conservation" deals with ecological studies of single species, e.g. *Limoniscus violaceus*, *Lucanus cervus*, *Osmoderma eremita* and the worldwide distribution of the genus *Cucujus*. "Advances in methodology and databases" discusses new techniques in trapping and the development of databases. This volume gives a nice overview of the actual research on saproxylic beetles in Europe and I wish the next conference in 2010 a successful meeting; maybe some people from the UK or even overseas should be invited.

#### **Genomes 4 - T. A. Brown 2018-12-07**

Genomes 4 has been completely revised and updated. It is a thoroughly modern textbook about genomes and how they are investigated. As with Genomes 3, techniques come first, then genome

anatomies, followed by genome function, and finally genome evolution. The genomes of all types of organism are covered: viruses, bacteria, fungi, plants, and animals including humans and other hominids. Genome sequencing and assembly methods have been thoroughly revised including a survey of four genome projects: human, Neanderthal, giant panda, and barley. Coverage of genome annotation emphasizes genome-wide RNA mapping, with CRISPR-Cas 9 and GWAS methods of determining gene function covered. The knowledge gained from these techniques forms the basis of the three chapters

that describe the three main types of genomes: eukaryotic, prokaryotic (including eukaryotic organelles), and viral (including mobile genetic elements). Coverage of genome expression and replication is truly genomic, concentrating on the genome-wide implications of DNA packaging, epigenome modifications, DNA-binding proteins, non-coding RNAs, regulatory genome sequences, and protein-protein interactions. Also included are applications of transcriptome analysis, metabolomics, and systems biology. The final chapter is on genome evolution, focusing on the evolution of the epigenome, using genomics to

study human evolution, and using population genomics to advance plant breeding. Established methods of molecular biology are included if they are still relevant today and there is always an explanation as to why the method is still important. Each chapter has a set of short-answer questions, in-depth problems, and annotated further reading. There is also an extensive glossary. Genomes 4 is the ideal text for upper level courses focused on genomes and genomics. *Archaeology in Africa. Potentials and perspectives on laboratory & fieldwork research* - Savino di Lernia 2019-09-24

Africa encompasses a multitude of environments and biomes that require specific scientific strategies – from desktop studies to field research to laboratory analysis – to tackle research questions that may range from the emergence of early humans to the ethnoarchaeological investigation. In several areas, turmoil, social instability and security constraints hamper or limit field activities and long-term funded programs. The kidnapping of German colleagues and the tragic death of two local collaborators in Nigeria urge to rethink our agenda and challenge our view of current research practice. This 1st

Workshop on “Archaeology in Africa”, organized by Sapienza University of Rome, convened several researches from Italy or Italy-based researchers. The aim was to present and discuss theoretical, methodological and financial problems for Africanist researchers today. In a global perspective, the synergy between research groups is crucial. The need to intensify the national and international cooperation is also an essential step. This book collects a selection of the different perspectives presented to the workshop, mostly focussing from North Africa and East Africa.

*A Conceptual History of Modern Embryology -*

Scott F. Gilbert 2013-11-11

"Glory to the science of embryology!" So Johannes Holtfreter closed his letter to this editor when he granted permission to publish his article in this volume. And glory there is: glory in the phenomenon of animals developing their complex morphologies from fertilized eggs, and glory in the efforts of a relatively small group of scientists to

understand these wonderful events. Embryology is unique among the biological disciplines, for it denies the hegemony of the adult and sees value (indeed, more value) in the stages that lead up to the fully developed organism. It seeks the origin, and not merely the maintenance, of the body. And if embryology is the study of the embryo as seen over time, the history of embryology is a second-order derivative, seeing how the study of embryos changes over time. As Jane Oppenheimer pointed out, "Science, like life itself, indeed like history, itself, is a historical phenomenon. It can build itself only out of its

past. " Thus, there are several ways in which embryology and the history of embryology are similar. Each takes a current stage of a developing entity and seeks to explain the paths that brought it to its present condition. Indeed, embryology used to be called *Entwicklungsgeschichte*, the developmental history of the organism. Both embryology and its history interpret the interplay between internal factors and external agents in the causation of new processes and events.

*Racial Theories in Fascist Italy* - Aaron Gillette
