Human Biology - Michael D. Johnson

Concepts of Biology - Samantha Fowler
2018-01-07

Concepts of Biology is designed for the

single-semester introduction to biology
course for non-science majors, which for
many students is their only college-level
science course. As such, this course
represents an important opportunity for
students to develop the necessary
knowledge, tools, and skills to make
informed decisions as they continue with
their lives. Rather than being mired down
with facts and vocabulary, the typical non-
science major student needs information
presented in a way that is easy to read and
understand. Even more importantly, the
content should be meaningful. Students do
much better when they understand why
biology is relevant to their everyday lives.
For these reasons, Concepts of Biology is
grounded on an evolutionary basis and
includes exciting features that highlight
careers in the biological sciences and
everyday applications of the concepts at
hand. We also strive to show the

interconnectedness of topics within this extremely broad discipline. In order to meet the needs of today's instructors and students, we maintain the overall organization and coverage found in most syllabi for this course. A strength of *Concepts of Biology* is that instructors can customize the book, adapting it to the approach that works best in their classroom. *Concepts of Biology* also includes an innovative art program that incorporates critical thinking and clicker questions to help students understand--and apply--key concepts.

Biology of Humans - Judith Goodenough

Each chapter now opens with new “Did You Know?” questions that pique your interest with intriguing and little-known facts about the topic that follows. The Fifth Edition also features a new “Special Topic” chapter (1a) titled “Becoming a Patient: A Major Decision,” which discusses how to select a doctor and/or a hospital, how to research health conditions, and more.

Principles of Economics - Alfred Marshall 1890

Ecology - Manuel Carl Molles 2002

This introductory general ecology text features a strong emphasis on helping students grasp the main concepts of ecology while keeping the presentation more applied than theoretical. An evolutionary perspective forms the foundation of the entire discussion. Evolution is brought to center stage throughout the book, as it is needed to

support understanding of major concepts.

The discussion begins with a brief introduction to the nature and history of the discipline of ecology, followed by section I, which includes two chapters on natural history--life on land and life in water. The intent is to establish a common foundation of natural history upon which to base the later discussions of ecological concepts. The introduction and natural history chapters can stand on their own and should be readily accessible to most students. They may be assigned as background reading, leaving 17 chapters to cover in a one-semester course. Sections II through VI build a hierarchical perspective: section II concerns the ecology of individuals; section III focuses on population ecology; section IV presents the ecology of interactions; section V summarizes community and ecosystem ecology; and finally, section VI discusses large-scale ecology and includes chapters

on landscape, geographic, and global ecology. These topics were first introduced in section I within a natural history context. In summary, the book begins with the natural history of the planet, considers portions of the whole in the middle chapters, and ends with another perspective of the entire planet in the concluding chapter.
