Introduction to Modeling and Control of Internal Combustion Engine Systems - Lino Guzzella 2013-03-14

Internal combustion engines still have a potential for substantial improvements, particularly with regard to fuel efficiency and environmental compatibility. These goals can be achieved with help of control systems. Modeling and Control of Internal Combustion Engines (ICE) addresses these issues by offering an introduction to cost-effective model-based control system design for ICE. The primary emphasis is put on the ICE and its auxiliary devices. Mathematical models for these processes are developed in the text and selected feedforward and feedback control problems are discussed. The appendix contains a summary of the most important controller analysis and design methods, and a case study that analyzes a simplified idle-speed control problem. The book is written for students interested in the design of classical and novel ICE control systems.

An Investigation of Adaptive Signal Processing Approaches to Active Combustion Control - Michael A. Vaudrey 2001

There has been significant progress made in understanding dynamic models and control system designs for active control of thermoacoustic instabilities. During the past several years, there has been an increasing trend away from mostly empirical or experimentally-based active combustion control (ACC) methods in exchange for control systems that rely on more accurate understanding of the dynamic processes involved in the thermoacoustic limit cycling response. Early demonstrations of phase-shifting ACC designs (Gutmark et al., 1993; McManus et al., 1990)

relied simply on a measurement of the acoustic pressure and actuation of the unsteady heat release after appropriate delay (i.e. phase shift) relative to the measured pressure signal. The phase-shifting controllers proved to be effective in many situations but were plagued by inadequacy knowledge of how to predict the required phase, and gain, of the controller for varying operating conditions of the combustor. These problems naturally led to investigations of adaptive control methods.

The Coen & Hamworthy Combustion Handbook - Stephen Londerville 2013-03-25

Control of Fuel Combustion in Boilers - Artur O. Zaporozhets 2020-04-13

This book examines key issues in improving the efficiency of small and medium power boiler units by adding control systems for the fuel combustion process. The original models, algorithms, software and hardware of the system developed for controlling the fuel combustion process are presented. In turn, the book presents a methodology for assessing the influence of climatic factors on the combustion process, and proposes new methods for measuring the thermophysical characteristics, which require taking into account the concentration of oxygen in the air. The system developed here was implemented on a boiler of the NIISTU-5 type, which is widely used for heat power engineering in Ukraine and other Eastern European countries. Given its scope, the book offers a valuable asset for researchers and engineers, as well as lecturers and graduate students at higher education institutions dealing with heat engineering equipment.

Automated Boiler Combustion Controls for Emission Reduction and Efficiency Improvement. Quarterly Report, July 15-- September 15, 1995 - 1995

Control Techtronics International (CTI) is conducting a project to reduce air emissions and increase efficiency in coal fired boilers in Krakow,

Poland and to create a commercial venture in Poland which can act as a leader for efficient combustion in boilers throughout the region. To achieve the technical goals of the project, CTI will use a three part program as follows: analyze the fuel specifications of a given plant and recommend modifications as necessary; apply automatic combustion controls systems to the boilers; and train plant operators in proper plant operation as well as proper use of control systems. To achieve the commercial goals, CTI will form a commercial venture in Poland to market and service the CTI program after successful demonstration. In Budget Period One, CTI demonstrated the efficiency improvement and emission reduction at MPEC's Balicka district heading plant in the Widok section of Krakow. CTI worked with several organizations to accomplish this work. The Pennsylvania State University (PSU) provided technical assistance in analysis of the fuel quality, technical assistance in the application of the controls, training material and techniques, and project management assistance. The Politechnika Krakowska (PK) conducted performance tests on the boilers at Balicka and conducted training in the Polish language. Naftokrak-Naftobudowa (NK) was the installing contractor. MPEC is the owner of the host site for the first CTI installation. Energoparatura (ENAP) built the control panels that were engineered by CTI and contain both Polish and American components. CTI is also interfacing with the Honeywell system heating controls in the Widok district.

An All-digital Simulation and Analysis of the Cva-63 Boiler and Automatic Combustion Control System - Charles Arthur Vinroot 1970

An all digital simulation of the existing boiler and control system of CVA-63 was carried out. A significant savings in computer time over previous simulations was realized. The parameter-plane method was used to search for new operating points for each of the system minor control loops. Individual loop transient response was tested with a simulation program to demonstrate improved response with new operating points. The entire system response was then investigated to demonstrate the overall effects. Recommendations were made for new controller settings along with component variations in order to improve over-all system response. (Author).

Boiler Control Systems Engineering - G. F. (Jerry) Gilman 2010

This book is for anyone who works with boilers: utilities managers, power plant managers, control systems engineers, maintenance technicians or operators. The information deals primarily with water tube boilers with Induced Draft (ID) and Forced Draft (FD) fan(s) or boilers containing

only FD fans. It can also apply to any fuel-fired steam generator. Other books on boiler control have been published; however, they do not cover engineering details on control systems and the setup of the various control functions. Boiler Control Systems Engineering provides specific examples of boiler control including configuration and tuning, valve sizing, and transmitter specifications. This expanded and updated second edition includes drum level compensation equations, additional P&ID drawings and examples of permissive startup and tripping logic for gas, oil, and coal fired boilers. It also covers different control schemes for furnace draft control. NFPA 85 Code 2007 control system requirements are included, with illustrated examples of coal fired boilers, as well as information on the latest ISA-77 series of standards.

Analog Simulation of Pressure-fired Steam Generator, Supercharger, and Control System - J. W. Banham (Jr) 1968

An analog computer simulation of the DE1040 Class pressure-fired steam generator, supercharger, combustion controls, and feedwater regulator was prepared. Information for dynamic modeling was obtained from a combination of open and closed loop experimental data and from theoretical analysis. Tests of the simulation transient response were conducted for comparison with recorded data obtained from a real system in order to establish the validity of the model. Agreement was considered satisfactory. Evaluation of four proposed variations on the basic configuration of the combustion control system was conducted. Of these variations, one in particular produced excellent results in terms of improvement of stability and transient response. This scheme employed a proportional controller, amplifying a positive error from the combustion air flow closed loop, to operate the supercharger steam turbine accelerating valve. It was recommended that this scheme be further evaluated. (Author).
