Grandmaster Versus Amateur - Jacob Aagaard 2011

A multinational array of top grandmasters explain the difference in thinking between professional and amateur chess players, and how the amateur can bridge the gap. It usually takes at least a decade of sustained effort for even the most talented player to reach the grandmaster level -- this book cannot guarantee to make the reader a chess grandmaster, but it is certainly a healthy nudge in the right

direction. The editors, ex-British Champion GM Jacob Aagaard and three-time Scottish Champion GM John Shaw, have recruited a line-up of strong grandmasters to share their wisdom.

Playing the Canterbury Tales - Andrew Higl 2016-04-22

Playing the Canterbury

Tales addresses the additions, continuations, and reordering of the Canterbury Tales found in the manuscripts and early printed editions of the Tales. Many modern editions present a specific set of tales in a specific order, and often leave out an entire corpus of continuations and additions. Andrew Higl makes a case for understanding the additions and changes to Chaucer's original open and fragmented work by thinking of them as distinct interactive moves in a game similar to the storytelling game the pilgrims play. Using examples and theories from new media studies, Higl demonstrates that the Tales are best viewed as an "interactive fiction," reshaped by active readers. Readers participated in the

ongoing creation and production of the tales by adding new text and rearranging existing text, and through this textual transmission, they introduced new social and literary meaning to the work. This theoretical model and the boundaries between the canonical and apocryphal texts are explored in six case studies: the spurious prologues of the Wife of Bath's Tale, John Lydgate's influence on the Tales, the Northumberland manuscript, the ploughman character, and the Cook's Tale. The Canterbury Tales are a more dynamic and unstable literary work than usually encountered in a modern critical edition.

Emotional Intelligence -

Daniel Goleman 1996

Is IQ destiny? Not nearly as much as we think. This fascinating and persuasive program argues that our view of human intelligence is far too narrow, ignoring a crucial range of abilities that matter immensely in terms of how we do in life.

Drawing on groundbreaking brain and behavioral research, Daniel Goleman shows the factors at work when people of high IQ flounder and those of modest IQ do well. These factors add up to a different way of being smart -- one he terms "emotional intelligence." This includes self-awareness and impulse control, persistence, zeal and

self-motivation, empathy and social deftness.

These are the qualities that mark people who excel in life, whose relationships flourish, who are stars in the workplace. Lack of emotional intelligence can sabotage the intellect and ruin careers. Perhaps the greatest toll is on children, for whom risks include depression, eating disorders, unwanted pregnancies, aggressiveness and crime. But the news is hopeful. Emotional intelligence is not fixed at birth, and the author shows how its vital qualities can be nurtured and strengthened in all of us. And because the emotional lessons a child learns actually sculpt the brain's circuitry, he provides guidance as to how parents and schools can best use this window of

opportunity in childhood. The message of this eye-opening program is one we must take to heart: the true "bell curve" for a democracy must measure emotional intelligence

The Second Chinese Revolution - E. Bregolat
2016-04-30

The Second Chinese Revolution explores some of the keys to understanding China, a country whose evolution already affects all of us. Beginning in 1978 - when China's GDP was only 6% of the USA's - the author takes us through the different aspects that have played a fundamental role in the country's change: China's eruption in world markets in the

background of the West's economic crisis; its obsession with science and technology and its relentless march towards a 'knowledge society'; and a reassessment of the Tiananmen Square events of June 1989 and the ongoing debate on political reform. The book also includes a comparative analysis of the reforms in China and Russia in the last decades.

Uses of Technology in Primary and Secondary Mathematics Education -

Lynda Ball 2018-05-14

This book provides international perspectives on the use of digital technologies in primary, lower secondary and upper secondary school mathematics. It gathers contributions by the members of three topic study groups from the 13th International Congress on Mathematical Education and covers a range of themes that will appeal to researchers and

practitioners alike. The chapters include studies on technologies such as virtual manipulatives, apps, custom-built assessment tools, dynamic geometry, computer algebra systems and communication tools. Chiefly focusing on teaching and learning mathematics, the book also includes two chapters that address the evidence for technologies' effects on school mathematics. The diverse technologies considered provide a broad overview of the potential that digital solutions hold in connection with teaching and learning. The chapters provide both a snapshot of the status quo of technologies in school mathematics, and outline how they might impact school mathematics ten to twenty years from now.

Emotion and the Arts -
Mette Hjort 1997-09-04

The only work of its kind, this exciting collection assembles a number of analytically minded philosophers, psychologists, and literary theorists, all of whom seek to provide fine-grained accounts of critical problems having to do with emotion and art. How best to explain emotions produced by works of art? What goes on when we feel emotion for an abstract art such as music? How is it that we can intelligibly feel emotion for persons and situations that we know are fictional? What is involved in our empathic experience of negative emotion through the art of tragedy? A strongly interdisciplinary volume that captures the richness of current debates about the role of agency in human emotional response, this collection also considers the influence of culture on emotion

and demonstrates that cognitivist and social-constructivist perspectives need not be antagonistic and may actually work together in a complementary way. Essays cluster under four rubrics--"The Paradox of Fiction", "Emotion and its Expression through Art", "The Rationality of Emotional Responses to Art", and "The Value of Emotion"--and together they address questions of emotion in film, painting, music, dance, literature, and theater. With new work by leading thinkers in the field of aesthetics, and drawing upon state of the art scholarship from areas such as cognitive science, literary studies, and contemporary ethics, *Emotion and the Arts* is essential reading for those who study aesthetics, literature, theories of emotion, and

the mind.

Teaching Tech Together -

Greg Wilson 2019-10-08

Hundreds of grassroots groups have sprung up around the world to teach programming, web design, robotics, and other skills outside traditional classrooms. These groups exist so that people don't have to learn these things on their own, but ironically, their founders and instructors are often teaching themselves how to teach. There's a better way. This book presents evidence-based practices that will help you create and deliver lessons that work and build a teaching community around them. Topics include the differences between different kinds of learners, diagnosing and correcting misunderstandings, teaching as a performance art, what

motivates and demotivates adult learners, how to be a good ally, fostering a healthy community, getting the word out, and building alliances with like-minded groups. The book includes over a hundred exercises that can be done individually or in groups, over 350 references, and a glossary to help you navigate educational jargon.

Daughters of the Reconquest - Heath Dillard 1984

'[This] vivid and sensitive portrayal of Castilian townswomen ... provides an important source for any comparative study of the social changes that urbanism engendered'. -- Diane Owen Hughes, Journal of Interdisciplinary History 'Heath Dillard demonstrates how living on the frontiers of Christian Europe influenced women's

position within urban settlements of the Reconquest ... [Her] study is not of an interesting sidelight of political expansion, but of a critical aspect of that expansion ... This is an important book because it does an in-depth analysis of sources and a topic that needed to be brought to the forefront of Hispanic studies.' -- Joyce E. Salisbury, *Speculum - A Journal of Mediaeval Studies* 'Carefully researched and cogently presented, [this] groundbreaking effort ... is bound to challenge familiar notions and help scholars reformulate them on firmer bases ... The book is packed with interesting information ... Heath Dillard has performed a real service by sifting through piles of historical documents to bring to life for us the many different kinds

of women who lived in the towns of Castile during the Middle Ages.'

Trigonometric Delights -

Eli Maor 2011-12-20

Trigonometry has always been the black sheep of mathematics. It has a reputation as a dry and difficult subject, a glorified form of geometry complicated by tedious computation. In this book, Eli Maor draws on his remarkable talents as a guide to the world of numbers to dispel that view.

Rejecting the usual arid descriptions of sine, cosine, and their trigonometric relatives, he brings the subject to life in a compelling

blend of history, biography, and mathematics. He presents both a survey of the main elements of trigonometry and a unique account of its vital contribution to science and social development. Woven together in a tapestry of entertaining stories, scientific curiosities, and educational insights, the book more than lives up to the title *Trigonometric Delights*. Maor, whose previous books have demystified the concept of infinity and the unusual number "e," begins by examining the "proto-trigonometry" of the Egyptian pyramid builders. He shows how Greek astronomers developed the first true trigonometry. He traces the slow emergence of modern, analytical trigonometry, recounting its colorful origins in Renaissance Europe's

quest for more accurate artillery, more precise clocks, and more pleasing musical instruments. Along the way, we see trigonometry at work in, for example, the struggle of the famous mapmaker Gerardus Mercator to represent the curved earth on a flat sheet of paper; we see how M. C. Escher used geometric progressions in his art; and we learn how the toy Spirograph uses epicycles and hypocycles. Maor also sketches the lives of some of the intriguing figures who have shaped four thousand years of trigonometric history. We meet, for instance, the Renaissance scholar Regiomontanus, who is rumored to have been poisoned for insulting a colleague, and Maria Agnesi, an eighteenth-century Italian genius who gave up mathematics to work with the poor--

but not before she investigated a special curve that, due to mistranslation, bears the unfortunate name "the witch of Agnesi." The book is richly illustrated, including rare prints from the author's own collection. Trigonometric Delights will change forever our view of a once dreaded subject.

Endgame Play - Jacob Aagaard 2014

Jacob Aagaard presents the reader with a few key concepts in the endgame in chess and invites him to test his skills with a lot of examples from recent tournament practice. Positional Play - Jacob

Aggaard 2013-06-04

Have there been times during a game when you have tried to calculate like mad, but can find no rhyme or reason to your lines? Have you ever felt that the computer's suggestions in your post-mortem analysis make no sense to you? Ever felt like the man with a hammer, suspecting that the world may not be made up entirely of nails after all? In Positional Play Jacob Aggaard shares his simple three-step tool of positional analysis that he has used with club players and famous grandmasters to improve their positional decision-making. Working from the starting point that all players who aspire to play at international level have a certain amount of positional understanding, Aggaard lays out an easy-to-follow training plan

that will improve everyone's intuition and positional decision-making.

Build Up Your Chess 1 - Artur Yusupov 2008-09-01
Artur Yusupov's complete course of chess training stretches to nine volumes, guiding the reader towards a higher chess understanding using carefully selected positions and advice. To make sure that this new knowledge sticks, it is then tested by a selection of puzzles. The course is structured in three series with three levels. The Fundamentals level is the easiest one, Beyond the Basics is more challenging, and Mastery is quite difficult, even for stronger players. The various topics – Tactics, Strategy, Positional Play, Endgames, Calculating Variations, and Openings – are spread evenly across the nine volumes,

giving readers the chance to improve every area as they work through the books. This book is the first volume at the Fundamentals level. The Build Up Your Chess series won the prestigious Boleslavsky Medal from FIDE (the World Chess Federation) as the best instructional chess books in the world.

GIS and Multicriteria Decision Analysis -

Jacek Malczewski
1999-04-05

From selecting sites for new hospitals, schools,

and factories, to managing forests and rivers, to creating and maintaining highways and bridges, public and private organizations are often called on to make decisions on geographic questions that involve a multitude of alternatives and often conflicting evaluation criteria.

This book presents a formal mechanism for dealing with these situations, capturing the information in a Geographic Information System and processing it to derive optimal recommendations for confronting these complex questions.

Representations of Space and Time - Donna J. Peuquet 2002-06-20

Recent advances in information technology have enabled scientists to generate unprecedented amounts of earth-related data, with tremendous potential for

dealing with pressing social, economic, and environmental issues. Yet the volume and heterogeneity of available data clearly overwhelm traditional analytical approaches, as well as the human capacity to derive patterns and useful insights. This book examines how geospatial knowledge can be analyzed and represented in a manner that not only is accurate and coherent, but also makes intuitive sense to the end user. Integrating concepts and approaches from geography, computer science, cognitive psychology, and philosophy, Donna J. Peuquet explores the processes by which people acquire, represent, and utilize spatiotemporal knowledge. Arguing that the human user and the computer must be viewed as interrelated

components of a single system, she provides principles and recommendations for improving the design of geographic information systems (GIS) and other geospatial modeling tools. An ideal student text or professional reference, this book fills a crucial need in geographic information science.

The Man in the Wall -
James Laughlin 1993
James Laughlin has been
called the American
Catullus. Like that most
Greek of ancient Latin
poets, he elevates his
everyday subjects with
wit and clarity of
language. Love and hate,
death and aging,
politics, literature,
travel, the horrors of
war - Laughlin's muse
speaks of all these
things with a fresh
directness that makes
his poems both timeless
and contemporary. The
founder of New
Directions, Laughlin's
efforts as publisher and
poet have been to
prolong and extend the
old poetic traditions.
Poetry for him is, in
Gertrude Stein's phrase,
a "continuous present"
in all times and
cultures. Laughlin

developed his
distinctive tight
metrics with the advice
of William Carlos
Williams. A longer,
comical line is found in
the recent poems of
Laughlin's doppelganger,
Hiram Handspring. The
Man in the Wall follows
Laughlin's recent
Collected Poems (Moyer

The Wrong War - Bing
West 2012-02-21
NATIONAL BESTSELLER In

this definitive account of the conflict, acclaimed war correspondent and bestselling author Bing West provides a practical way out of Afghanistan. Drawing on his expertise as both a combat-hardened Marine and a former assistant secretary of defense, West has written a tour de force narrative, rich with vivid characters and gritty combat, which shows the consequences when strategic theory meets tactical reality. Having embedded with dozens of frontline units over the past three years, he takes the reader on a battlefield journey from the mountains in the north to the opium fields in the south. A fighter who understands strategy, West builds the case for changing course. His conclusion is sure to provoke debate: remove most of

the troops from Afghanistan, stop spending billions on the dream of a modern democracy, and insist the Afghans fight their own battles. Bing West's book is a page-turner about brave men and cunning enemies that examines our realistic choices as a nation. Attacking Manual - Jacob Aagaard 2009-11
Attacking Manuals 1 & 2 comprise the first thorough examination of the nature of dynamics in chess, and the principles explained in this book are relevant to every chess game played. In lively non-nonsense language, Aagaard explains how the best players in the world attack. The rules of attack (the exploitation of a dynamic advantage) are explained in an accessible and entertaining style. This groundbreaking work is

well balanced between easily understandable examples, exercises and deep analysis. Volume 2 covers what to do once the attack is up and running, and deals with weak kings, intuitive sacrifices, opposite castling, king hunts, and enduring initiative. Attacking Manuals 1 & 2 were chosen as the English Chess Federation's Book of the Year 2010.

Teaching and Learning for the Twenty-First Century - Fernando M. Reimers 2019-01-02

This book describes how different nations have defined the core

competencies and skills that young people will need in order to thrive in the twenty-first-century, and how those nations have fashioned educational policies and curricula meant to promote those skills. The book examines six countries—Chile, China, India, Mexico, Singapore, and the United States—exploring how each one defines, supports, and cultivates those competencies that students will need in order to succeed in the current century. Teaching and Learning for the Twenty-First Century appears at a time of heightened attention to comparative studies of national education systems, and to international student assessments such as those that have come out of PISA (the Program for International Student Assessment), led by the Organisation for

Economic Co-operation and Development. This book's crucial contribution to the burgeoning field of international education arises out of its special attention to first principles—and thus to first questions: As Reimers and Chung explain, "much can be gained by an explicit investigation of the intended purposes of education, in what they attempt to teach students, and in the related questions of why those purposes and how they are achieved." These questions are crucial to education practice and reform at a time when educators (and the students they serve) face unique, pressing challenges. The book's detailed attention to such questions signals its indispensable value for policy makers, scholars, and education leaders today.

Fractal Cities - Michael Batty 1994-01-01

Fractal Cities is the pioneering study of the development and use of fractal geometry for understanding and planning the physical form of cities, showing how this geometry enables cities to be simulated through computer graphics. The book explains how the structure of cities evolve in ways which at first sight may appear irregular, but when understood in terms of fractals reveal a complex and diverse underlying order. The book includes numerous illustrations and 16 pages full-color plates of stunning computer graphics, along with explanations of how to construct them. The authors provide an accessible and thought-provoking introduction to fractal geometry, as

well as an exciting visual understanding of the form of cities. This approach, bolstered by new insights into the complexity of social systems, provides one of the best introductions to fractal geometry available for non-mathematicians and social scientists. *Fractal Cities* is useful as a textbook for courses on geographic information systems, urban geography, regional science, and fractal geometry. Planners and architects will find that many aspects of fractal geometry covered in this book are relevant to their own interests. Those involved in fractals and chaos, computer graphics, and systems theory will also find important methods and examples germane to their work. Michael Batty is Director of the National Center for

Geographic Information and analysis in the State University of New York at Buffalo, and has worked in planning theory and urban modeling. Paul Longley is a lecturer in geography at the University of Bristol, and is involved in the development of geographic information

systems in urban policy analysis. Richly illustrated, including 16 pages of full-color plates of brilliant computer graphics Provides an introduction to fractal geometry for the non-mathematician and social scientist Explains the influence of fractals on the evolution of the physical form of cities
