*Essentials of Stochastic Processes* - Richard Durrett 2016-11-07

Building upon the previous editions, this textbook is a first course in stochastic processes taken by undergraduate and graduate students (MS and PhD students from math, statistics, economics, computer science, engineering, and finance departments) who have had a course in probability theory. It covers Markov chains in discrete and continuous time, Poisson processes, renewal processes, martingales, and option pricing. One can only learn a subject by seeing it in action, so there are a large number of examples and more than 300 carefully chosen exercises to deepen the reader's understanding. Drawing from teaching experience and student feedback, there are many new examples and problems with solutions that use TI-83 to eliminate the tedious details of solving linear equations by hand, and the collection of exercises is much improved, with many more biological examples. Originally included in previous editions, material too advanced for this first course in stochastic processes has been eliminated while treatment of other topics useful for applications has been expanded. In addition, the ordering of topics has been improved; for example, the difficult subject of martingales is delayed until its usefulness can be applied in the treatment of mathematical finance.

**Traders, Guns and Money** - Satyajit Das 2012-08-21

Traders Guns and Money is a wickedly comic exposé of the culture, games and pure deceptions played out every day in trading rooms around the world. And played out with other people's money. A sensational insider's view of the business of trading and marketing derivatives, this revised edition explains the frighteningly central role that derivatives and financial products played in the global financial crisis. This worldwide bestseller reveals the truth about derivatives: those financial tools memorably described by Warren Buffett as 'financial weapons of mass destruction'. Traders, Guns and Money will introduce you to the players and the practices and reveals how the real money is made and lost. The global financial crisis took almost everyone by surprise and even now new problems keep appearing and solutions continue to be elusive. In the original version of Traders, Guns and Money, Satyajit Das provided a highly prescient insight into the structure and risk of the world financial system exposing the problems that are becoming readily apparent. In a 2006 speech - The Coming Credit Crash - Das argued that: "an informed analysis ... shows that risk is not better spread but more leveraged and (arguably) more concentrated.... This does not improve the overall stability and security of the financial system but exposes it to increased risk of a "crash".

**Credit Risk Modeling** - David Lando 2009-12-13

Credit risk is today one of the most intensely studied topics in quantitative finance. This book provides an introduction and overview for readers who seek an up-to-date reference to the central problems of the field and to the tools currently used to analyze them. The book is aimed at researchers and students in finance, at quantitative analysts in banks and other financial institutions, and at regulators interested in the modeling aspects of credit risk. David Lando considers the two broad approaches to credit risk analysis: that based on classical option pricing models on the one hand, and on a direct modeling of the default probability of issuers on the other. He offers insights that can be drawn from each approach and demonstrates that the distinction between the two approaches is not at all clear-cut. The book strikes a fruitful balance between quickly presenting the basic ideas of the models and offering enough detail so readers can derive and implement the models themselves. The discussion of the models and their limitations and five technical appendixes help readers expand and generalize the models themselves or to understand existing generalizations. The book emphasizes models for pricing as well as statistical techniques for estimating their parameters. Applications include rating-based modeling, modeling of dependent defaults, swap- and corporate-yield curve dynamics, credit default swaps, and collateralized debt obligations.

Law and Intersystemic Communication - Gorm Harste 2016-04-15  
With contributions from experts in the field of sociology of law, this book provides an overview of current perspectives on socio-legal studies. It focuses particularly on the relationship between law and society described in recent social systems theory as 'structural coupling'. The first part of the book presents a reconstruction of theoretical tendencies in the field of socio-legal studies, characterised by the emergence of a transnational model of legal systems no longer connected to territorial borders and culturally specific aspects of single legal orders. In the following parts of the book, the contributions analyse some concrete cases of interrelation between law and society from an empirical and theoretical perspective.
