Geriatric Medicine - Christine K. Cassel 2006-05-29

Since the publication of the third edition of Geriatric Medicine, extraordinary advances have occurred in the science of aging and the potential for biomedical research to give us answers to many, if not most, of the age-related disorders that threaten the quality of life in older years. At the most basic level, the successful mapping of the human genome was declared complete in the fall of 2000. Understanding the map of the human genome is as important as understanding the map of genomes of important laboratory species, ranging from the microscopic worms and fruit?ies used in most classic genetic studies to rodents such as laboratory mice, and eventually to primates, on which much of the research on the aging human brain is done. The genetic maps of all of these species, including our own, does not answer clinical questions, but it does open the door to dramatic, rapid, and efficient answers to questions about the genetic polymorphisms related to diseases in humans. The telomerase story also unfolded since the third edition. Telomerase is an enzyme responsible for maintaining the telomeres—the redundant DNA portions at the end of chromosomes—whose shortening seems to be linked directly to cell senescence, apoptosis, and the control over cell death, which, at the level of the individual cell, seems to be linked to the decline of organ function and eventually aging and death within the organism.

Geriatric Medicine - Frank Lally 2014

People are living longer and the population over the age of 60 is burgeoning, with repercussions for health services and healthcare expenditure in developed countries. Crucially, disease aetiology, diagnosis, and treatment in older people differ from the general adult population. Older people often have complicated co-morbidities and respond to treatment in different ways compared to younger people. Evidence of efficacy of different treatments is often lacking because older people are under-represented in clinical trials, and the specific needs of older people are rarely discussed specifically in more general texts. Geriatric medicine: an evidence based approach is a clinical reference for health care professionals who manage older patients, and summarizes up-to-date research literature in a style that can be directly applied by busy healthcare professionals and provide a useful resource for reference.

Geriatric Medicine - Balakrishnan Kichu R. Nair 2017-09-18

Written by international experts, this book presents chapters that cover common geriatric conditions including dementia, depression, delirium, falls, polypharmacy, incontinence, immobility, and medication-related issues, as well as neurological, cardiovascular, and endocrine diseases associated with old age. The book also discusses various aspects of ambulatory, residential, and palliative care for the elderly, in addition to ethical aspects of old age care, advance care planning and living wills. Geriatric medicine is a rapidly growing field in internal medicine. The majority of elderly people now live in developing countries, where there is an urgent need to up-skill healthcare professionals. By presenting problems as they arise and then discussing how to solve them, this book offers a valuable resource for all physicians interested in the care of older people.

Geriatric Medicine - C.K. Cassel 2012-12-06

With the appearance of a textbook as comprehensive as this one, it is clear that the field of geriatrics is coming of age. The broad scope of these volumes shapes a substantial answer to the question, "What is geriatrics and why should we be interested in it?" As I see it, there are at least five reasons. First, the scientific or intellectual reason: gerontology is the study of aging from the biologic, psychological, and social perspectives. There is increasing interest in the fascinating insights into the biologic mechanisms of aging, errors in protein synthesis, DNA repair mechanisms, alterations of the neuroendocrine system, changes in the immune system, genetic controls, and somatic mutations. Second, the demographic reason: this is the century of old age. There has been a 26-year gain in the average life expectancy. This gain compares with that acquired from 3,000 years B.C. (the Bronze Age) to the year 1900, which was about 29 years. Therefore, in one century, there has been a gain in the average life expectancy almost equal to 5,000 previous years of human history. In 1830, one of three newborn infants survived beyond 60 years of age.

WHO Global Report on Falls Prevention in Older Age - World Health Organization 2008

The WHO Falls Prevention for Active Ageing model provides an action plan for making progress in reducing the prevalence of falls in the older adult population. By building on the three pillars of falls prevention, the model proposes specific strategies for: 1. Building awareness of the importance of falls prevention and treatment; 2. Improving the assessment of individual, environmental, and societal factors that increase the likelihood of falls; and 3. For facilitating the design and implementation of culturally appropriate, evidence-based interventions that will significantly reduce the number of falls among older persons. The model provides strategies and solutions that will require the engagement of multiple sectors of society. It is dependent on and consistent with the vision articulated in the WHO Active Ageing Policy Framework. Although not all of the awareness, assessment, and intervention strategies identified in the model apply equally well in all regions of the world, there are significant evidence-based strategies that can be effectively implemented in all regions and cultures. The degree to which progress will be

made depends on to the success in integrating falls prevention strategies into the overall health and social care agendas globally. In order to do this effectively, it is necessary to identify and implement culturally appropriate, evidence-based policies and procedures. This requires multi-sectoral, collaborations, strong commitment to public and professional education, interaction based on evidence drawn from a variety of traditional, complementary, and alternative sources. Although the understanding of the evidence-base is growing, there is much that is not yet understood. Thus, there is an urgent need for continued research in all areas of falls prevention and treatment in order to better understand the scope of the problem worldwide. In particular, more evidence of the cost-effectiveness of interconnections is needed to develop strategies that are most likely to be effective in specific setting and population sub-groups.

Orthogeriatrics - Paolo Falaschi 2020

This new open access edition supported by the Fragility Fracture Network aims at giving the widest possible dissemination on fragility fracture (especially hip fracture) management and notably in countries where this expertise is sorely needed. It has been extensively revised and updated by the experts of this network to provide a unique and reliable content in one single volume. Throughout the book, attention is given to the difficult question of how to provide best practice in countries where the discipline of geriatric medicine is not well established and resources for secondary prevention are scarce. The revised and updated chapters on the epidemiology of hip fractures, osteoporosis, sarcopenia, surgery, anaesthesia, medical management of frailty, peri-operative complications, rehabilitation and nursing are supplemented by six new chapters. These include an overview of the multidisciplinary approach to fragility fractures and new contributions on pre-hospital care, treatment in the emergency room, falls prevention, nutrition and systems for audit. The reader will have an exhaustive overview and will gain essential, practical knowledge on how best to manage fractures in elderly patients and how to develop clinical systems that do so reliably.

Geriatric Drug Therapy Interventions - James W Cooper 1998-02-02

Medication costs and common drug-related problems, such as misapplication of therapy, medication misuse, and adverse effects, can often be avoided or reduced. Geriatric Drug Therapy Interventions will help you get better outcomes with your patients as it points out pitfalls to avoid and provides you with logical principles for administering drug therapy. Offering guidelines, advice, and gentle reminders, this book shows you the importance of properly documenting patient problems and of considering the entire medical history of your patients. It also helps you perform fall and psychoactive drug risk assessments and address under-recognized and undertreated problems such as malnutrition, depression, sensory deficits, anemia, osteoporosis, and pressure ulcers. As Geriatric Drug Therapy Interventions clarifies, increased consultant pharmacist involvement in comprehensive pharmaceutical services results in the reduction of drug-related problems and medication-associated costs with long-term care patients. Using this book's helpful and substantive interventions, you can improve clinical, economic, and humanistic outcomes in your practice. For this purpose, Geriatric Drug Therapy Interventions discusses: a study designed to teach pharmacy students to identify, document, solve, and prevent medication-related problems providing patient-focused care and assuming responsibility for patient outcomes reimbursing pharmacists for performing cognitive service and cost-savings activities how the prevalence of drug-related problems that influence the need for hospital and nursing home admissions increases with age reasons for patient noncompliance NSAID-associated gastritis, gastrointestinal bleeding, drug-induced delirium, incontinence, and constipation why the advent of managed care does not bode well for the overall health outcomes of the elderly Pharmacists, physicians, and other health care providers can't control all aspects of drug use, but there are many practical steps you can take to help your patients use their prescriptions appropriately. Geriatric Drug Therapy Interventions will help you monitor the efficacy of drug therapy, guide patients who are exasperated with being poked, prodded, and barraged with medications, and work together to develop therapy patterns and schedules that are effective and comfortable.

Geriatric Emergency Medicine - Christian Nickel 2017-12-11

This book discusses all important aspects of emergency medicine in older people, identifying the particular care needs of this population, which all too often remain unmet. The up-to-date and in-depth coverage will assist emergency physicians in identifying patients at risk for adverse outcomes, in conducting appropriate assessment, and in providing timely and adequate care. Particular attention is paid to the common pitfalls in emergency management and means of avoiding them. Between 1980 and 2013, the number of older patients in emergency departments worldwide doubled. Compared with younger patients, older people suffer from more comorbidities, a higher mortality rate, require more complex assessment and diagnostic testing, and tend to stay longer in the emergency department. This book, written by internationally recognized experts in emergency medicine and geriatrics, not only presents the state of the art in the care of this population but also underlines the increasing need for adequate training and development in the field.

Value Driven Healthcare and Geriatric Medicine - James S. Powers 2018-05-04

Value driven healthcare is the lasting legacy of the Affordable Care Act, which had three goals: to improve access to healthcare by increasing healthcare insurance coverage, to improve the patient's experience and quality of care, and to slow the rate of increase in healthcare costs. Regardless of changes to the financing of healthcare or changes in policy, value-based purchasing for healthcare is to remain a constant feature of the healthcare horizon. Value-based purchasing is a demand side strategy to reward quality in health care delivery. Value-based purchasing involves cost considerations and includes the actions of employers, the public sector, health plans, and individual consumers in making healthcare decisions. Effective health care services and high performing health care providers are incentivized to provide quality outcomes and to control cost. Value-based purchasing drives quality metrics which are publicly reported and serve as important levers for changes in healthcare delivery. Geriatric patients consume a disproportionate share of healthcare resources, so CMS directs Medicare and drives geriatric healthcare models. All other insurers generally model CMS/Medicare guidelines. Innovative geriatric care models which demonstrate improved outcomes and cost moderation are scaled and lessons learned used to create new healthcare models. The best data for broader value driven healthcare comes from the geriatric models, which currently have the best data available. This book traces the origins of value-based purchasing and current geriatric care models and synthesizes their implications for today's changing health system. It also discusses healthcare accountability and risk sharing. The audience includes geriatric healthcare professionals, but also a wider audience interested in broader healthcare models and value driven healthcare from a policy, economic, and ethical perspective. These include primary care physicians, specialists who work with aging patients, hospital administrators, healthcare educators, healthcare organizations, and all medical professionals working with aging patients and patients affected by healthcare reform.

Quality care for elderly people - Edward J. Dickinson 2013-11-11

This book is all about improving the health care of elderly people, which is facing unprecedented challenges in the 1990s. Energies need to be concentrated in three main areas: • the development of high quality care in community settings • the future role of specialized hospital services • the way that long-term care is delivered. All of these are interconnected and success with any of them depends on successful relationships. For example, success in community care requires working interfaces with primary care, the private sector and hospital care. These interfaces are not static but comprise dynamic interactions between people - people in different teams, with different back grounds, training, perspectives and interests. What people do is influenced strongly by the organizations they work for. These inescapable facts lead us to the structure of this book. By concentrating on sectors, people and organizations, we hope to deal with all the important relationships in a coherent way. Yet this book is not intended to be from a service providers' perspective. We have arranged the book in this way so that providers are best equipped to meet the needs of their customers - whether they are patients, residents or clients. We know that elderly people may experience dislocation in their care because of frictions and gaps between different sectors, disciplines, teams and organizations. To achieve seamless care, there is a need for greater understanding and harmony of purpose and action across the care spectrum.
