The Rape Of Nanking - Iris Chang
2014-03-11

The New York Times bestselling account of one of history's most

brutal -- and forgotten -- massacres, when the Japanese army destroyed China's capital city on the eve of World War II. In December 1937, one of the most horrific atrocities in the long annals of wartime barbarity occurred. The Japanese army swept into the ancient city of Nanking (what was then the capital of China), and within weeks, more than 300,000 Chinese civilians and soldiers were systematically raped, tortured, and murdered. In this seminal work, Iris Chang, whose own grandparents barely escaped the massacre, tells this history from three perspectives: that of the Japanese soldiers, that of the Chinese, and that of a group of Westerners who refused to abandon the city and created a safety zone, which saved almost 300,000 Chinese. Drawing on extensive interviews with

survivors and documents brought to light for the first time, Iris Chang's classic book is the definitive history of this horrifying episode. "Chang vividly, methodically, records what happened, piecing together the abundant eyewitness reports into an undeniable tapestry of horror." - Adam

The Book of Acts in Its Graeco-Roman Setting - David W. J. Gill 1994-05

The Book of Acts in Its Graeco-Roman Setting locates the Book of Acts within various regional and cultural settings in the eastern Mediterranean. These studies draw on recent archaeological fieldwork and epigraphic discoveries to describe the key cities and provinces within

the Roman Empire. The relevant societal aspects of these regions, such as the Roman legal system, Roman religion, and the problem of transport and travel, all help contextualize the book of Acts.

St Stephen's Green - Frank Hopkins 2020-05-06

A random collection of tales of human

tragedy, eccentrics, crime and punishment, hanging and rioting on 'The Green'. 'The Green' for several hundred years was effectively the killing fields of Dublin, where the city's criminals were taken to be hanged. Within these pages you will find tales of high-profile executions and lesser-known ones such as the hanging of the brothel-keeper Darky Kelly and the barbaric execution of Mary Fairfield the last person to be hanged there [1784]. Also included are Dan 'The Liberator,' who fought a battle with his love rival at Harcourt Fields, the champion archer Celia Betham, and Bridget Hitler, sister-in-law of Adolf. Tales of rioting on the Green, a race in the Iveagh Gardens between a man and a horse called Rover and a host of characters and incidents that you

won't find in any guidebook.

Reinforcement Learning, second edition - Richard S. Sutton
2018-11-13
The significantly expanded and updated new edition of a widely used text on reinforcement learning, one of the most active research areas in artificial intelligence.
Reinforcement learning, one of the most active research areas in artificial intelligence, is a computational approach to learning whereby an agent tries to maximize the total amount of reward it receives while interacting with a

complex, uncertain environment. In Reinforcement Learning, Richard Sutton and Andrew Barto provide a clear and simple account of the field's key ideas and algorithms. This second edition has been significantly expanded and updated, presenting new topics and updating coverage of other topics. Like the first edition, this second edition focuses on core online learning algorithms, with the more mathematical material set off in shaded boxes. Part I covers as much of reinforcement learning as possible without going beyond the tabular case for which exact solutions can be found. Many algorithms presented in this part are new to the second edition, including UCB, Expected Sarsa, and Double Learning. Part II extends these ideas to function

approximation, with new sections on such topics as artificial neural networks and the Fourier basis, and offers expanded treatment of off-policy learning and policy-gradient methods. Part III has new chapters on reinforcement learning's relationships to psychology and neuroscience, as well as an updated case-studies chapter including AlphaGo and AlphaGo Zero, Atari game playing, and IBM Watson's wagering strategy. The final chapter discusses the future societal impacts of reinforcement learning.

Partial Differential Equations -

Walter A. Strauss 2007-12-21

Partial Differential Equations presents a balanced and comprehensive introduction to the concepts and techniques required to solve problems containing unknown functions of

multiple variables. While focusing on the three most classical partial differential equations (PDEs)—the wave, heat, and Laplace equations—this detailed text also presents a broad practical perspective that merges mathematical concepts with real-world application in diverse areas including molecular structure, photon and electron interactions, radiation of electromagnetic waves, vibrations of a solid, and many more. Rigorous pedagogical tools aid in student comprehension; advanced topics are introduced frequently, with minimal technical jargon, and a wealth of exercises reinforce vital skills and invite additional self-study. Topics are presented in a logical progression, with major concepts such as wave propagation, heat and

diffusion, electrostatics, and quantum mechanics placed in contexts familiar to students of various fields in science and engineering. By understanding the properties and applications of PDEs, students will be equipped to better analyze and interpret central processes of the natural world.

Quantities, Units and Symbols in Physical Chemistry - E Richard Cohen
2007-10-31

The first IUPAC Manual of Symbols and Terminology for Physicochemical Quantities and Units (the Green Book) of which this is the direct successor, was published in 1969, with the object of 'securing clarity and precision, and wider agreement in the use of symbols, by chemists in different countries, among physicists, chemists and engineers, and by editors of scientific

journals'. Subsequent revisions have taken account of many developments in the field, culminating in the major extension and revision represented by the 1988 edition under the simplified title Quantities, Units and Symbols in Physical Chemistry. This 2007, Third Edition, is a further revision of the material which reflects the experience of the contributors with the previous editions. The book has been systematically brought up to date and new sections have been added. It strives to improve the exchange of scientific information among the readers in different disciplines and across different nations. In a rapidly expanding volume of scientific literature where each discipline has a tendency to retreat into its own jargon this book attempts to provide a readable

compilation of widely used terms and symbols from many sources together with brief understandable definitions. This is the definitive guide for scientists and organizations working across a multitude of disciplines requiring internationally approved nomenclature.

Green River Killer - Jeff Jensen
2015-11-10

Throughout the 1980s, the highest priority of Seattle-area police was the apprehension of the Green River Killer, the man responsible for the murders of dozens of women. In 1990, with the body count numbering at least 48, the case was put in the hands of a single detective, Tom Jensen. After 20 years, when the killer was finally captured with the help of DNA technology, Jensen spent

180 days interviewing Gary Leon Ridgway in an effort to learn his most closely held secrets - an epic confrontation with evil that was every bit as disturbing and surreal as can be humanly imagined.

But in any life a set of circumstance can collide, and normal behaviour might soon shade into something sinister, something deadly. *Lighter Than My Shadow* is a hand-drawn story of struggle and recovery, a trip into the black heart of a taboo illness, an exposure of those who are so weak as to prey on the vulnerable, and an inspiration to anybody who believes in the human power to endure towards happiness. Discrete Choice Methods with Simulation - Kenneth Train 2009-07-06
This book describes the new

generation of discrete choice methods, focusing on the many advances that are made possible by simulation. Researchers use these statistical methods to examine the choices that consumers, households, firms, and other agents make. Each of the major models is covered: logit, generalized extreme value, or GEV (including nested and cross-nested logits), probit, and mixed logit, plus a variety of specifications that build on these basics. Simulation-assisted estimation procedures are investigated and compared, including maximum stimulated likelihood, method of simulated moments, and method of simulated scores. Procedures for drawing from densities are described, including variance reduction techniques such as anithetics and Halton draws. Recent advances in

Bayesian procedures are explored, including the use of the Metropolis-Hastings algorithm and its variant Gibbs sampling. The second edition adds chapters on endogeneity and expectation-maximization (EM) algorithms. No other book incorporates all these fields, which have arisen in the past 25 years. The procedures are applicable in many fields, including energy, transportation, environmental studies, health, labor, and marketing.
