Selman's The Fundamentals of Imaging Physics and Radiobiology - Victor White
2020-10-16

This tenth edition of Selman's The Fundamentals of Imaging

Physics and Radiobiology is the continuation of a seminal work in radiation physics and radiation biology first published by Joseph Selman, MD, in 1954 by Charles C Thomas, Publisher, Ltd., Springfield, IL. Many significant changes have been made in this tenth edition. Color photographs and new illustrations have been provided for several existing chapters and for the new chapters in this book. Revisions and updates have been completed for Chapters 1 through 28, whereas Chapters 29 to 33 are all new. The overall style of Doctor Selman is still present, but, with any revision, the style of the present author is also present. In essence, the author's *raison d'être* in revising this book was to better reflect current radiology practice and to honor the work of Doctor Selman. Topics discussed in this textbook deal with the physics of x-radiation, the biological interaction of radiation with matter, and all aspects of

imaging equipment and technology commonly found in the modern radiology department. The chapter on computed tomography (CT) has been heavily revised and updated. Protective measures regarding radiation safety and radiation hazards for workers and patients are thoroughly discussed and new chapters on dual energy x-ray absorptiometry (DXA), magnetic resonance imaging (MRI), ultrasound (US), fusion and molecular imaging have been added. This book will be very helpful to students about to take the ARRT (R) registry examination, but it is not a registry review book per se. This book also serves as a good overview of radiologic imaging physics for radiographers and other medical professionals.

Anatomy and articulation review includes assigned readings from the text, followed by self-assessment labeling exercises. Pre- and post-testing feature offers self-assessment quiz for students to evaluate their own learning needs before taking the exam. Special Situations cover unique situations frequently encountered in the clinical environment, including both routine and

special projections, with narrated animations, slide shows, and clinical situations requiring student response. Image Evaluations present radiographic images showing positioning and technical errors, with questions for the student to answer online plus a discussion board. Learning Links direct students to related sites on the Internet, then pose related questions. Capstone module provides an excellent review tool, pulling information presented in the other modules and providing a series of interactive case scenarios involving multiple regions of the body for the student to assess, evaluate, and solve. Available on Evolve, Angel, Blackboard, and WebCT platforms. Designed to be used in a variety of learning environments: as a supplement to traditional lecture-format classroom learning with the instructor assigning particular portions for review and completion outside of class for

distance learning for self-study with students logging on, completing lessons, and taking quizzes and exams online with results recorded for the instructor. Modules 1, 2, and 3 present an introduction to positioning and radiation protection, plus anatomy and positioning terminology. Modules 4-24 cover radiography of various bone groups and areas of the body. Each module is organized as follows: Introduction and Objectives Pre-test with 25 questions Reading assignments from the text Anatomy and Articulation Review Routine Projections Overview Routine Projections Review Special Situations - highlights imaging challenges presented by certain injuries and diseases Image Evaluations Exam with 40 questions Module 25 Capstone is a summative module.
