Drug-Induced Headache - Hans-Christoph Diener 2012-12-06

M. WILKINSON Patients with frequent or daily headaches pose a very difficult problem for the physician who has to treat them, particularly as many patients think that there should be a medicine or medicines which give them instant relief. In the search for the compound which would meet this very natural desire, many drugs have been manufactured and the temptation for the physician is either to increase the dose of a drug which seems to be, at any rate, partially effective, or to add one or more drugs to those which the patient is already taking. Although there have been some references to the dangers of overdosage of drugs for migraine in the past, it was not until relatively recently that it was recognized that drugs given for the relief of headache, if taken injudiciously, may themselves cause headache. The first drugs to be implicated in this way were ergotamine and phenazone. In the case of ergotamine tartrate, the dangers of ergotism were well known as this was a disorder which had been known and written about for many years. In the treatment of headache, fully blown ergotism is rare and in recent years has usually been due to self-medication in doses much greater than those prescribed although there are a few recorded cases where toxic amounts have been given.

Functional Evaluation of Stroke Patients - Naoichi Chino 2012-12-06

Stroke is one of the major causes of disability in the world. Consequently, an effective rehabilitation regimen is the goal of specialists working in the field worldwide. The implementation of rehabilitation programs for the stroke patient is broad in scope and requires, first of all, an objective scientific evaluation method. In 1980 the World Health Organization developed the International Classification of Impairments, Disabilities, and Handicaps. It categorized impairments and disabilities on the basis of functional evaluation but took into account cultural and socioeconomic factors when defining handicaps, thus making it difficult to use the same functional evaluation instrument for the three phenomena. In this monograph, experts in the treatment of stroke from Japan, the United States, and Europe share their ideas presented during the 31st Annual Convention of the Japanese Association of Rehabilitation Medicine held in June 1994. All the participants freely contributed their views on the functional assessment and prognosis of stroke patients. Indeed, their contributions shed light on possible breakthroughs in the future for the development of rehabilitation regimens for stroke patients.

Thrombolytic Therapy for Stroke - Patrick D. Lyden 2001-02-23

Thrombolytic Therapy for Stroke is intended for physicians who will be treating patients in the first few hours after stroke: neurologists, neurosurgeons, emergency medicine physicians, internists, and radiologists. In some areas, family medicine general practice physicians may provide the majority of acute stroke care. We will provide the reader with all the data necessary to understand the utility and limitations of thrombolytic therapy. By reading the protocols, and working through the case tutorials, the reader will become sufficiently familiar with the indications and contraindications of thrombolytic therapy to begin evaluating potential patients. Although nothing can replace direct instruction by more experienced physicians, we hope that by imparting our accumulated knowledge we may guide those physicians who cannot attend a "hands-on" workshop, or who, having heard the appropriate lectures, feel the need for further guidance. We will review the scientific rationale for thrombolysis: first, most ischemic stroke is caused by thrombo-emboli; second, a portion of brain, the penumbra, remains salvageable for a few hours after vascular occlusion; and third, promptly delivered thrombolysis can remove the offending occlusion and restore cerebral blood flow to the penumbra in time to salvage brain and neurologic function. Then we will review the preclinical development of thrombolytics for stroke patients and the early pilot trials. Next, we will present the pivotal clinical trials that demonstrated the efficacy and safety of thrombolysis.

ICD-10-CM: Official Guidelines for Coding and Reporting - FY 2019 (October 1, 2018 - September 30, 2019) - Centers for Medicare and Medicaid Services (CMS) 2018-08

These guidelines have been approved by the four organizations that make up the Cooperating Parties for the ICD-10-CM: the American Hospital Association (AHA), the American Health Information Management Association (AHIMA), CMS, and NCHS. These guidelines are a set of rules that have been developed to accompany and complement the official conventions and instructions provided within the ICD-10-CM itself. The instructions and conventions of the classification take precedence over guidelines. These guidelines are based on the coding and sequencing instructions in the Tabular List and Alphabetic Index of ICD-10-CM, but provide additional instruction. Adherence to these guidelines when assigning ICD-10-CM diagnosis codes is required under the Health Insurance Portability and Accountability Act (HIPAA). The diagnosis codes (Tabular List and Alphabetic

Index) have been adopted under HIPAA for all healthcare settings.

Interview Questions and Answers - Richard McMunn 2013-05

Stroke Genetics - Hugh S. Markus 2003

Stroke is a major cause of death and the major cause of adult neurological disability in most of the world. Despite its importance on a population basis, research into the genetics of stroke has lagged behind that of many other disorders. However, the situation is now changing. An increasing number of single gene disorders causing stroke are being described, and there is growing evidence that polygenic factors are important in the risk of apparently "sporadic" stroke. *Stroke Genetics* provides an up-to-date review of the area, suitable for clinicians treating stroke patients, and both clinical and non-clinical researchers in the field of cerebrovascular disease. The full range of monogenic stroke disorders causing cerebrovascular disease, including ischaemic stroke, intracerebral haemorrhage, aneurysms and arteriovenous malformations, are covered. For each, clinical features, diagnosis, and genetics are described. Increasing evidence suggest that genetic factors are also important for the much more common multifactorial stroke; this evidence is reviewed along with the results of genetic studies in this area. Optimal and novel strategies for investigating multifactorial stroke, including the use of intermediate phenotypes such as intima-media thickness and MRI detected small vessel disease are reviewed. The book concludes by describing a practical approach to investigating patients with stroke for underlying genetic disorders. Also included is a list of useful websites.

ICD-10-CM Official Guidelines for Coding and Reporting - FY 2021 (October 1, 2020 - September 30, 2021) - Department Of Health And Human Services 2020-09-06

These guidelines have been approved by the four organizations that make up the Cooperating Parties for the ICD-10-CM: the American Hospital Association (AHA), the American Health Information Management Association (AHIMA), CMS, and NCHS. These guidelines are a set of rules that have been developed to accompany and complement the official conventions and instructions provided within the ICD-10-CM itself. The instructions and conventions of the classification take precedence over guidelines. These guidelines are based on the coding and sequencing instructions in the Tabular List and Alphabetic Index of ICD-10-CM, but provide additional instruction. Adherence to these guidelines when assigning ICD-10-CM diagnosis codes is required under the Health Insurance Portability and Accountability Act (HIPAA). The diagnosis codes (Tabular List and Alphabetic Index) have been adopted under HIPAA for all healthcare settings. A joint effort between the healthcare provider and the coder is essential to achieve complete and accurate documentation, code assignment, and reporting of diagnoses and procedures. These guidelines have been developed to assist both the healthcare provider and the coder in identifying those diagnoses that are to be reported. The importance of consistent, complete documentation in the medical record cannot be

overemphasized. Without such documentation accurate coding cannot be achieved. The entire record should be reviewed to determine the specific reason for the encounter and the conditions treated.
