Reinsurance Arbitrations - Kyriaki Noussia 2014-02-04 Following events such as the 2008 credit crunch and financial crisis, many sectors of the economy suffered; nevertheless, reinsurance managed to maintain its strong position in the market industry and the global economic arena.

Arbitration has traditionally been used in reinsurance, due in no small part to its effective, time- and cost-efficient nature. Hence, reinsurance contracts often include arbitration clauses requiring that any and all disputes arising under the contract be resolved by arbitration. The current work provides an in-depth treatment of reinsurance arbitrations and the various issues they entail in the most representative jurisdictions for such arbitrations. It also aims to pave the way for future directions of arbitration in the context of reinsurance. Any participant in the reinsurance market arena looking for a roadmap to the fascinating legal environment in which reinsurance arbitrations operate would be well advised to have this book on hand.

Why Have Exchange-Traded Catastrophe Instruments Failed to Displace Reinsurance? -

Rajna Gibson 2007

In spite of the fact that they can draw on a larger, more liquid and more diversified pool of capital than the equity of reinsurance companies, financial markets have failed to displace reinsurance as the primary risk-sharing vehicle for natural catastrophe risk. We show that this failure can be explained by differences in information gathering incentives between financial markets and reinsurance companies. Using a simple model of an insurance company that seeks to transfer a fraction of its risk exposure either through financial markets or through traditional reinsurance, we find that the supply of information by informed traders in financial markets may be excessive relative to its value for the insurance company, causing reinsurance to be preferred. We show that whether traditional reinsurance or financial markets are ultimately selected depends

crucially on the information acquisition cost structure and on the degree of redundancy in the information produced. Limits on the ability of informed traders to profitably take advantage of their information make the use of financial markets more likely.

Actuarial Pricing of Non-Proportional Reinsurance Treaties with an Application of Extreme Value Theory in Reinsurance Natural Catastrophe Modelling - 2015

This paper provides an overview of pricing of traditional nonproportional reinsurance treaties with a deeper focus on catastrophe excess of loss per event contracts. It overviews with examples actuarial pricing methods like burning cost, exposure rating and in greater detail, distributional methods and the relevant mathematical theory for determining the pure

premium. It covers in depth the application of extreme value theory with an example using the software R and the resulting Pareto rating. After describing different features of catastrophe contracts and their effect on the premium, a catastrophe contract is then priced using the Pareto rating in R. The sensitivity of the Cat XL pure premium to various assumptions is explained. Topics like comparing the prices of catastrophe programmes, natural catastrophe modelling, the payback method and determination of loadings are also summarized with examples. *New York Court of Appeals. Fundamentals of the Insurance Business -
Massimiliano Maggioni
2021-09-08

This textbook presents the fundamental economic dimensions of insurance companies and links them to managerial issues.

Combining academic rigour and a strongly practice-oriented approach, it addresses both the competitive environment and the management of the insurance business. Further, it provides a general overview of insurance undertakings and technical topics are explained in depth. Filling an important gap in the market for textbooks on the insurance business, it is divided into four parts and 35 chapters. Part I (chapters 1 to 10) describes the fundamentals of the business, how the industry works, the Authorities and the regulations. It presents the insurance products (for life, non-life retail, and non-life commercial lines). Part II

(chapters 11 to 17) explains the pricing and reserving for life and non-life insurance. Reinsurance business is also illustrated. Part III (chapters 18 to 25) describes business models in the industry and the organizational structures. The main processes of an insurance company (product development, underwriting, claims settlement, investments) are presented. Marketing and distribution are also described. Part IV (chapters 26 to 35) defines the financial statement and introduces IFRS principles. Solvency II calculation, ALM model, and Embedded Value are explained in detail. This part also describes management accounting, performance indicators, and the Business Plan in the insurance industry. The book offers a valuable resource for lower and upper undergraduate students, graduate students, professionals/practitioners working at insurance companies, insurance

agents, brokers, bankers, and consultants.

The Financing of Catastrophe Risk -

Kenneth A. Froot 2007-12-01

Is it possible that the insurance and reinsurance industries cannot handle a major catastrophe? Ten years ago, the notion that the overall cost of a single catastrophic event might exceed \$10 billion was unthinkable. With ever increasing property-casualty risks and unabated growth in hazard-prone areas, insurers and reinsurers now envision the possibility of disaster losses of \$50 to \$100 billion in the United States. Against this backdrop, the capitalization of the insurance and reinsurance industries has become a crucial concern. While it remains unlikely that a single event might entirely bankrupt these industries, a big catastrophe could place firms under severe stress, jeopardizing both policy holders and investors and causing profound ripple effects

throughout the U.S. economy. The Financing of Catastrophe Risk assembles an impressive roster of experts from academia and industry to explore the disturbing yet realistic assumption that a large catastrophic event is inevitable. The essays offer tangible means of both reassessing and raising the level of preparedness throughout the insurance and reinsurance industries.

Summary of Reinsurance Activities and Rating Actions Tied to Selected Insurers Involved in the Failed "Unicover" Venture - 2001

As you requested, this report provides information about activities associated with the highly publicized losses of an estimated \$1 to \$2 billion experienced by companies involved in reinsuring the occupational accident portion of workers' compensation (W/C) insurance policies. These W/C "occupational accident" policies, commonly referred to as W/C "carve-out"

policies, were brought to the reinsurance market by Unicover Managers, Inc. (Unicover), a reinsurance pool manager and intermediary. As explained further in enclosure I, reinsurance is the acceptance by one insurance company (the reinsurer) of a portion of the risk or claims loss underwritten by another insurance company for a share of the premium to support that risk. In a reinsurance pool arrangement, a number of reinsurers combine their capital and delegate underwriting authority to a pool manager that is normally not exposed to risk from the reinsurance. At the time this report was being prepared, legal and settlement activities were ongoing among insurance companies, firms engaged as reinsurance brokers, and the reinsurance pool managers involved with the failed Unicover reinsurance activities. As a result, for

this report, we relied on information from sources other than the involved industry parties. As agreed with your office, the objectives of this correspondence are to (1) summarize the business activities and events associated with losses of the failed Uncover venture and (2) describe the actions taken by five rating agencies on selected companies that were exposed to these losses. Additionally, we agreed to provide a brief update of regulatory efforts that were initiated as a result of the Uncover matter.

On the Basis Risk of Industry Loss Warranties

- Elena Rudnikevic 2012-03 Seminar paper from the year 2012 in the subject Business economics - Banking, Stock Exchanges, Insurance, Accounting, grade: 2,0, Friedrich-Alexander University Erlangen-Nuremberg, language: English, abstract: The following paper

discusses industry loss warranties (ILWs). The aim of this essay is to analyze basis risk with the help of Excel simulation study and to perform a risk and pricing sensitivity analysis. Furthermore, on the basis of obtained results the hedging effectiveness of ILW contracts in comparison to traditional reinsurance shall be assessed. In company with traditional reinsurance and catastrophic bonds (cat bonds) ILWs protect buyers against natural catastrophes. The increased number of natural disasters in last years (Hurricane Katrina and Ivan in 2005, Hurricane Irene in 2011) led to lack of supply capacity in the traditional reinsurance and retrocession market. Insurers required additional capital. Therefore new and innovative catastrophic instruments - such as industry loss warranties or cat bonds - were developed (see Gatzert and Schmeiser, 2009, p.2). These new index-linked instruments

have several advantages in comparison to traditional reinsurance, e.g. reduction of moral hazard or lower underwriting costs, but a potential buyer has also to consider the drawbacks: The most important one is basis risk (see Gatzert and Kellner, 2011a, p. 132). In the beginning this paper describes the characteristics of ILWs and discusses their pros and cons in comparison to other insurance instruments. In addition, the most common definitions of basis risk are introduced. An introduction of simulation study follows, beginning with a theoretical presentation of the approach used in the study. Subsequently, every single step as well as the formulas and the methods used are described. A following numerical analysis discusses the obtained results from the simulation study and sensitivity analysis. Lastly a conclusion is drawn, where ILWs and their hedging of

Reinsurance - R.L. Carter

2013-11-11

There may be some readers of this book who are expecting a sort of Mrs Beeton of reinsurance, whose indications if carefully followed will ensure the satisfactory outcome of any reinsurance operation undertaken. They will, I fear, be disappointed for reinsurance is first and foremost a commercial enterprise, whose successful conduct depends upon so much that cannot be written in books or committed to paper. Above all else, it depends upon people and on the personalities of people as much as on their technical skills. Most reinsurers are born and only some are made, but none the less for either sort this book will be of inestimable benefit as a guide to the principles that lie behind the transaction of a business at once as complex and widespread as reinsurance is by its very nature. One of the main characteristics of this highly specialized

business is the infinite variety of situations to which the reinsurer is called upon to adapt his business methods making any standardization of practice possible only on a broad, as opposed to a detailed, basis. This renders any attempt to encompass in one book all the practical alternatives and differences in approach to technical reinsurance problems a virtual impossibility.

Theory and Practice of Insurance - J. François Outreville 2012-12-06

Insurance is a concept, a technique, and an economic institution. It is a major tool of risk management, and plays an important role in the economic, social, and

political life of all countries. Economic growth throughout the world has even expanded the role of insurance. Theory and Practice of Insurance aims to describe the significance of insurance institutions, the reasons they exist and how they function. The author emphasizes fundamental principles in risk and insurance, using an international frame of reference. This volume begins with an introduction to the concept of risk, then proceeds to cover insurance and its relationship to the economy; the principles of risk management and insurance; and the characteristics and performance of insurance companies.

Making a Market for Acts of God - Paula Jarzabkowski
2015-03-19

Reinsurance is a financial market that trades in the risk of unpredictable and devastating disasters - such as Hurricane Katrina, the Tohoku earthquake and tsunami, and the terrorist attacks on the World Trade Centre. Such disasters are increasing in both frequency and severity, with the cost of their losses mounting rapidly. Reinsurance insures insurance companies, enabling them to pay claims arising from these losses. It is thus a market mechanism that is a critical part of the social and economic safety net, helping to pick up the pieces after disasters. Yet, how is the risk of such disasters calculated and traded in a global market? This book brings to life the reinsurance market through

vivid real-life tales that draw from an ethnographic, "fly-on-the-wall" study of the global reinsurance industry over three annual cycles. The authors shadowed underwriters around the world as they traded risks through multiple disasters. For instance, this book takes readers into the desperate hours of pricing Japanese risks during March 2011, while the devastating aftermath of the Tohoku earthquake is unfolding. To show how the market works, the book offers authentic tales gathered from observations of reinsurers in Bermuda, Lloyd's of London, Continental Europe and SE Asia as they evaluate, price and compete for different risks as part of their everyday practice. Understanding how this market for disasters works has never been more critical given the impact of climate change and increased global connectivity, where a flood in one country can trigger losses to supply chains

around the world. The authors develop a novel concept of how global markets work, which advances scholarship and challenges current thinking about how financial markets trade in intangible assets such as risk. This book will be useful to readers interested in markets for disasters, insurance, reinsurance and financial markets, and academics interested in the practice of financial markets specifically or the practice of strategy and organizations generally.

Reinsurance: Actuarial and Statistical Aspects provides a survey of both the academic literature in the field as well as challenges appearing in reinsurance practice and puts the two in perspective. The book is written for researchers with an interest in reinsurance problems, for graduate students with a basic

knowledge of probability and statistics as well as for reinsurance practitioners.

The focus of the book is on modelling together with the statistical challenges that go along with it. The discussed statistical approaches are illustrated alongside six case studies of insurance loss data sets, ranging from MTPL over fire to storm and flood loss data. Some of the presented material also contains new results that have not yet been published in the research literature. An extensive bibliography provides readers with links for further study.
