Rethinking the Internet of Things - Francis daCosta 2013-12-30

Apress is proud to announce that Rethinking the Internet of Things was a 2014 Jolt Award Finalist, the highest honor for a programming book. And the amazing part is that there is no code in the book. Over the next decade, most devices connected to the Internet will not be used by people in the familiar way that personal computers, tablets and smart phones are. Billions of interconnected devices will be monitoring the environment, transportation systems, factories, farms, forests, utilities, soil and weather conditions, oceans and resources. Many of these sensors and actuators will be networked into autonomous sets, with much of the information being exchanged machine-to-machine directly and without human involvement. Machine-to-machine communications are typically terse. Most sensors and actuators will report or act upon small pieces of information - "chirps". Burdening these devices with current network protocol stacks is inefficient, unnecessary and unduly increases their cost of ownership. This must change. The architecture of the Internet of Things must evolve now by incorporating simpler protocols toward at the edges of the network, or remain forever inefficient. Rethinking the Internet of Things describes reasons why we must rethink current approaches to the Internet of Things. Appropriate architectures that will coexist with existing networking protocols are described in detail. An architecture comprised of integrator functions, propagator nodes, and end devices, along with their interactions, is explored. What you'll learn Discusses the difference between the "normal" Internet and the Internet of Things. Describes a new architecture and its components in the "chirp" context. Explains the shortcomings of IP for IoT. Describes the anatomy of the IoT. Describes how to build a suitable network to maximize the amazing potential of the IoT. Who this book is for Thought leaders, executives, architectural, standards and development leaders in the evolving IoT industry. Corporations and organizations whose commercial products could be adapted simply to be functioning devices on the IOT while saving billions of dollars in unnecessary costs or proprietary designs. Those who wish to capitalize on technology change and those interested in the Internet, its capabilities and the need to improve it. Semantic and Logic Based Routing Algorithms for Service Discovery and Composition in Dynamic IoT-edge Networks - Hessam Moeini 2019

Internet of Things (IoT) interconnects billions of smart sensors, devices, actuators, as well as people, over a distributed environment. Many existing IoT systems are built with predefined tasks and system architecture. To make better use of the large number of "things" available in the IoT infrastructure, we consider to dynamically discover and compose IoT services in the IoT network for new or dynamically arising tasks. To achieve this goal, we develop semantic-based routing protocols for IoT service discovery. We also introduce a distributed planning algorithm in order to efficiently compose distributed IoT services to address dynamically arising tasks. We first consider how to specify the capabilities of the IoT devices and the discovery queries so as to facilitate effective matchmaking. We need to address multi-keyword based queries in the IoT systems. We have studied IoT services and capabilities and noticed that their specification is very different from handling documents. Generally, an IoT device can be specified by a main functionality together with some additional attributes. Thus, we introduce a two-level specification model in which a single keyword is used to specify the main functionality and the Bloom filters are used for specifying the attribute keywords of an IoT service. Next, we consider the memory constraints on IoT and edge devices and focus on the design of routing tables to achieve space-efficiency. We design a capability summarization algorithm to retain the most routing information within the routing table size bound of each IoT node. Our routing table summarization is based on a predefined ontology of IoT capabilities, i.e., the child capabilities can be summarized to a parent capability following the ontology tree. However, this approach will require each node in the IoT network to store the whole ontology tree, which defeats the space reduction goal. Thus, we design an OnBF coding scheme for our two-level approach. For the main functionality specification, we introduce an ontology coding scheme to support ontology-based summarization without needing the ontology tree. The attributes for the IoT service specification are captured in a Bloom filter. Based on OnBF, we design the routing table, the summarization algorithm, etc., to achieve efficient, multi-keyword based service discovery in IoT networks. We also consider how to compose IoT services to achieve the goals of some dynamically arising tasks. When a dynamic task arises, distributed planning is performed over the IoT network to discover the available IoT services and determine how to select and compose them. To ensure planning efficiency, a Logic-based Overlay Network of Services (LONS) is maintained and updated periodically. We then develop a decentralized Graphplan algorithm to traverse through the LONS to derive the desired service composition. Our approach also considers the mutual exclusion relations in the planning graph. Unlike some existing service composition models, our algorithm is comprehensive, fully distributed and efficient in terms of network traffic and the depth of output plan workflow.

Autonomous Control for a Reliable Internet of Services - Ivan Ganchev 2018-05-30

This open access book was prepared as a Final Publication of the COST Action IC1304

“Autonomous Control for a Reliable Internet of Services (ACROSS)”. The book contains 14 chapters and constitutes a show-case of the main outcome of the Action in line with its scientific goals. It will serve as a valuable reference for undergraduate and post-graduate students, educators, faculty members, researchers, engineers, and research strategists working in this field. The explosive growth of the Internet has fundamentally changed the global society. The emergence of concepts like SOA, SaaS, PaaS, IaaS, NaaS, and Cloud Computing in general has catalyzed the migration from the information-oriented Internet into an Internet of Services (IoS). This has opened up virtually unbounded possibilities for the creation of new and innovative services that facilitate business processes and improve the quality of life. However, this also calls for new approaches to ensuring the quality and reliability of these services. The objective of this book is, by applying a systematic approach, to assess the state-of-the-art and consolidate the main research results achieved in this area.
