And when seven Irish sisters, penniless and fatherless, grow up with hair cascading down their backs, to their ankles, and beyond, men are not slow to recognise their potential. It begins with a singing and dancing septet, but this is not what fills the seats: it is the torrents of hair they let loose at the end of each show. Their hair is a rich offering and will take the sisters out of poverty, through the dance halls of Ireland, to the salons of Dublin and the palazzi of Venice. It will bring them suitors and obsessive admirers, it will bring some of them love, and each of them loss. For their past trails behind the sisters like the tresses on their heads and their fame and fortune will come at a terrible price...

Recent Progress in Slow Sand and Alternative Biofiltration Processes -

Rolf Gimbel 2006-03-31

Slow sand filtration is typically cited as being the first "engineered" process in drinking-water treatment. Proven modifications to the conventional slow sand filtration process, the awareness of induced biological activity in riverbank filtration systems, and the growth of oxidant-induced biological removals in more rapid-rate filters (e.g. biological activated carbon) demonstrate the renaissance of biofiltration as a treatment process that remains viable for both small, rural communities and major cities.

Biofiltration is expected to become even more common in the future as efforts intensify to decrease the presence of disease-causing microorganisms and disinfection by-products in drinking water, to minimize microbial regrowth potential in distribution systems, and where operator skill levels are emphasized. *Recent Progress in Slow Sand and Alternative Biofiltration Processes* provides a state-of-the-art assessment on a variety of biofiltration systems from studies conducted around the world. The authors collectively represent a perspective from 23 countries and include academics, biofiltration system users, designers, and manufacturers. It provides an up-to-date perspective on the physical, chemical, biological, and operational factors affecting the performance of slow sand filtration

(SSF), riverbank filtration (RBF), soil-aquifer treatment (SAT), and biological activated carbon (BAC) processes. The main themes are: comparable overviews of biofiltration systems; slow sand filtration process behavior, treatment performance and process developments; and alternative biofiltration process behaviors, treatment performances, and process developments.

Using leading frameworks, this study provides applications and case studies about what shapes the competitiveness of places in an international context. Specific policies that enhance local competitiveness are identified and analyzed.
